S.J. Morning News - Aug. 17, 1842 His Excellency the Lieutenant Governor and Lady Colebrooke, visited Dr. Gesner's Museum, yesterday afternoon, and expressed great pleasure in viewing the establishment of his highly interesting and useful collection which has been produced by the labour of an individual."

Codes: GEOL / IDX_Names: Geology - General;
Royal Gazette - Dec. 3, 1842 Extract of a Report by Doctor Gesner, Provincial Geologist, dated Saint John, November 16, 1842. To His Excellency Sir William MacBean George Colebrooke, &c. &c. Having within the last five years explored almost all the inhabited districts, and the chief parts of the extensive tracts of public lands within the Province, during my professional duties, my attention has been directed to the soil of the unsettled parts of the Province, and to those resources which offer encouragement to Emigrants and other persons who may bedesirous of devoting themselves to Agriculture in New Brunswick. The inquiry has also been made how the ungranted lands of the Province might be made profitable to the Revenue, and advantageous to the surplus population of the Mother Country. I therefore beg leave to lay before Your Excellency a brief report taken from observations recorded in different parts of the Province, during the explorations in which I have been engaged. It is not necessary at present to enter upon a particular description of all the fertile tracts of waste lands which have been explored; they are found along almost all the tributaries of the St. John, and the upper branches of the Restigouche, and in the whole of the northern counties. The Province contains about 10,500,000 acres; of this quantity 12,000,000 acres are capable of immediate cultivation, and 1,000,000 may be reclaimed in a more advanced state of Agriculture. I have estimated that including the great marshes of Westmorland, only 440,000 acres are cleared. By obtaining a credit of the Government for fifty acres of land, any person with a family, having a capital of œ12 Currency (œ9 12s. sterling), can maintain such a family, until the first crop is produced, and with sobriety and industry in six years they can pay for the land with the interest on the first purchase, and purchase 50 acres more on credit. The above may be performed in a less time than six years, but I have taken this period as a medium estimate. The lands along the southern coast of the Province, are in general much less fit for cultivation, than those of the interior and northern shores. The settlers area also exposed to the dense fogs of the coast, but which seldom reach more than twenty miles from the seaboard. The soil, from being derived from granite and other hard rock, is more scanty along the southern coast, and it is frequently too stony to be extensively cultivated. There are nevertheless many small tracts of good upland, and some fine intervales along the rivers and smaller streams. Twenty miles from the southern seaboard the lands improve, and the whole northern side of the Province may be said to be capable of being tilled to advantage. The quality of the soil however differs in different districts, and there are many extensive tracts of waste lands of a superior quality. The several counties have been classed in regard to the lands they contain fit for immediate settlement, in the following order:- Saint John. - There is but a very limited quantity of good ungranted land in this county. The lands eastward of Quaco, and those recently laid out between Quaco and Hammond River, are in general broken and stony, and the gravelly nature of the soil is seldom discovered until the land is cleared of its timber; there are but few intervales in this county. Westmorland. - In the county of Westmorland there still remain some fine ungranted tracts. They are chiefly situated at the heads of Pollett and Coverdale Rivers, and Turtle Creek, and also at the sources of the Washadamoak. The soil in general is a sandy loam and it is easily worked. There is some intervale still ungranted. Queen's. - In Queen's county there are a number of tracts of excellent ungranted land. There is a large tract between the Nerepis Road and Gagetown, including the Victoria settlement. Also southward of the Nerepis Road, upon both sides of the Washadamoak River, above Long's Creek, and between Salmon River and New Canaan Settlement. Some of these soils are a deep red loam. Limestone was found to be abundant on both sides of the Saint John, it will be seen at the farm of Mr. Merrit and at the south entrance of the Washadamoak. Charlotte. - The best ungranted lands in this County were seen in the direction of the Magaguadavic River, and there are intervales along the principal streams. The northern part of this County abounds in

granitic rocks. The lands in the Tryon Settlement are in general rocky, and a part of the soil is meagre. Sunbury. - Almost all the ungranted lands in this County is of a good quality, and probably not more than one half of its surface is disposed of. There are some good intervales. York. - The best ungranted lands in this County are situated on the southeast side of the Nashwaak, and near the main South West Miramichi and Taxas River. Carleton. - Almost all the lands in this county are of a superior quality. Between the Saint John and the Main South West Miramichi, there is an immense tract of fertile soil, with belts of intervale along the streams. Very extensive settlements might be opened in this quarter. Farther westward there is a mountainous ridge; even here there are some superior lands, and the scenery is truly alpine. The Tobique river passes through a fine country for agriculture, where gypsum and limestone are abundant. The river is skirted with excellent intervales. These lands are not granted, and offer every advantage for settlement. Near the banks of the Saint John, the Grand Falls, and the Grand River, the land is good, and limestone is plentifully scattered over the county. Kent. - There are some good soils in this county, many of them are however light and sandy. Northumberland. - The good land in this county is too extensive to require any particular description, and there is much intervales along the streams. Gloucester. - The above remark will apply to the Northeastern part of Gloucester. There are nevertheless some low and swampy grounds in this quarter. Restigouche. - The lands near the mouth of the Restigouche are mountainous and broken. Southward of Dalhousie and Campbellton, there is a large tract of superior land; upon a part of this tract the Colebrooke settlement is situated. There are good lands in the upper part of the river. The interior of Gloucester and Restigouche counties have not been explored. Heretofore the attention of the inhabitants has been directed to Lumbering pursuits, and Agriculture has been neglected. From the low price of timber, during the past season, a greater amount of labour and care has been bestowed upon Agriculture, and the result has been, that the quantity of bread stuffs and other provisions raised, has been nearly doubled, and the capabilities of the soil have been more fairly tested than formerly. It has also been proven, that the climate of New Brunswick has been underrated. It may appear remarkable that in a country where excellent soils can be purchased from the Government at a low rate, there are so many persons to be found who have settled upon the public lands without grant or licence. This circumstance arises not so much from the price of land as from other causes. Men with families, who have been engaged in procuring timber, have had no desire to cultivate more than a few acres; as their employment has been in the forests, their abodes are considered temporary; and therefore they have not hesitated in numerous instances to enter upon waste lands, where from the decline of their employment, they are compelled to remain. Another class of squatters is found among those who from misfortune or extravagance, have been left without the means to purchase, and they have established themselves upon the public lands, feeling a security in the unwillingness of the Government to dispossess them. There are many instances in which young people have married hastily, and from being too proud to become day labourers, they have chosen to clear ungranted lands. There is another description of squatters composed of immigrants, who, after landing in the Province, have travelled into the forests with their wives and children, and from necessity alone have won a livlihood upon the public soil; almost all the families of this class are now in comfortable condition, a circumstance which at once shews the capabilities of the soil and climate. There is yet another class of persons whose abodes are on the public lands, who are the pioneers of the country - the advanced guards of civilization, and the forlorn-hope-men of the mountain, the river and the lake. Trained to the forest from their infancy, they rush into the woods, fell a few acres, and after raising a crop or two, they sell their improvements for a few pounds, and then advance still further into the wilderness. A more hardy and contented race of men can scarcely be found, and their wives equal them in fortitude and endurance. Such men are highly advantageous to a new country, and many of the fine settlements now seen in the Province were commenced by these wandering axemen. Indeed every class of squatters, by opening roads and making improvements, have increased the value of Crown property, and led many to the purchase and improvement of wild tracts. From the best information I have been able to obtain, there are no less than 4000 families in the Province settled on ungranted lands, and that number has been rapidly increasing since the depression in the lumber trade and reduction in the price of labor. It is evident that the uncertain tenure upon which squatters hold their lands, had a tendency to render them idle and extravagant, and they are generally careless in making very extensive improvements. Under the constant fear of being dispossessed, their ambition is relaxed, and this is one of the causes of their imperfect tillage of the ground. The plan proposed by Your Excellency to give a credit of fifty acres of land to actual settlers, upon their executing a bond for payment, and paying the interest of the amount in advance, cannot fail to promote the settlement of the waste lands. By reserving each alternate hundred acre lot, the value of the public lands will in the new settlements increase rapidly in value, and the government will gain by the measure. I am fully of the opinion that 50 acres are quite sufficient to grant upon credit to any individual. To purchase and pay down for another 50 acres, will be the ambition of almost every settler. Not less than four hundred persons who were born in the Province, and four hundred more who had emigrated from Great Britain, all residing in St. John, have cheerfully determined to settle wild lands in the different counties upon the above terms. Many of these, under other circumstances, would have emigrated to the United States, being unable to pay at once for fifty acres of land, and to maintain themselves in the forest until a crop could be raised. The abundant crops of the past season have greatly increased the desire for improving wilderness lands, and from twenty to thirty persons call upon me daily for information in regard to favorable tracts for settlement. There is another subject that requires some consideration. It is the manner of making surveys. It is not possible for any survey to be made correctly, where the variation of the Magnetic needle is not attended to. In a country where the variation is constantly increasing, and their are numerous causes of local attraction, care should be taken to ascertain the true variation, and back sights should always be had to discover any local attraction that may exist. I have tried the variation of the Magnetic Needle in different parts of the Province, and find that it varies from 17ø to 24ø westerly. It would be highly advantageous to establish several Meridian lines in the Province, to aid the surveyors in each district; and their compasses and circumferences should be compared on one of these Meridians in order to determine their correctness. (signed) A. Gesner. From official returns 3,634,290 acres have been granted, and 13,792,272 remain at the disposal of the Crown. Alluvial

S.J. Morning News - Dec. 21, 1842 Dr. Gesner's Museum!- By reference to an advertisement in another column, it will be perceivedthat the Doctor has enlarged his Museum of Natural History, by taking in another room for the collection. In our next, we shall advert to the subject at greater length."

N.B. Courier - Dec. 24, 1842 Gesner's Museum. - We have much pleasure in referring to an advertisement of this establishment in another column. The Museum, which contains many rare specimens of Natural History, and among the number, some of the winders of our own forests, has recently been muchenlarged, and now occupies two spacious rooms in the brick building of Duncan Robertson, Esquire, Prince William Street. It is now open every week day and we expect will attract numerous visitors, especially during the Christmas Holidays."

S.J. Morning News - Feb. 13, 1842 Geological Report. - We have been kindly presented by Dr. Gesner, with his Fourth Report on the Geology of New Brunswick. Our time, however, has been so taken up of late, that as yet, we have been unable even to open the book. It shall, however, receive our earliest attention."

St. Andrews Standard - Jul. 29, 1842 and Morning News - Aug. 1, 1842 Provincial Geology.- Dr. Gesner left town this morning by the Eastern Coach for Amherst, there to meet the celebrated Mr. Lyell, the President of the Royal Geological Society of London, from whence, we understand these gentlemen proceed together to make an examination of the great Coal Field in the vicinity of the Chignecto Basin. We are much gratified to hear that Mr. Lyell intends making this personal inspection of the mineral wealth of our Province, to which his attention was first attracted by the reports of Dr. Gesner, with whom he has corresponded for some time past, and we trust that New Brunswick will hereafter make a conspicuous figure in Mr. Lyell's works.- Courier and Halifax Gazette."

S.J. Morning News - Jun. 27, 1842 ADVERTISEMENT:Gesner's Museum of Natural History, Prince William Street, is open to the public every day, (Sunday excepted), from 12 to 4 P.M."

Novascotian - Mar. 3, 1842 An interesting Geological Report of New Brunswick, for 1841, has been published by Doctor Gesner, the official Geologist of that Province. We have not had theopportunity of examination, but doubt not that it is marked by that interest and learning which have hitherto characterised the Doctor's works."

Morning News - Oct. 5, 1842 ADVERTISEMENT: Gesner's Museum Of Natural History,(Robertson's Brick Building, Prince William st.) Museum open on Mondays, Wednesdays, and Fridays, from 12 to 4 p.m. Price of Admission 1s. 3d. Yearly Admissions at all times during hours -For a lady or gentleman ... 10 s."

Novascotian - Oct. 6, 1842 Dr. Gesner is now at the Restigouche, or on his way thither, for the purpose of laying out three new townships on the upper part of that noble river, above the present settlements, which extend a very short distance only above the head of the tide. The Restigouche has hitherto been considered the boundary between the Province and Canada, but from the headwaters of the main branch of that river, (which main-branch is not yet clearly defined, there being three or four branches ofnearly equal size) the line to the St. John is altogether undetermined. Formerly, the Courts at Quebec exercised jurisdiction on the St. John, down to Grand Falls, but of late years, the jurisdiction has extended no further down than the lower line of the Seignerie of Madawaska, which extends about twelve miles down the Madawaska river, from Lake Temiscouta, or about half way from the lake down to the river St. John, at a place called the Golden Farm, belonging to John Caldwell. One of the first proceedings of the Legislature at its next session, will be for defining the boundary between the Province and Canada, and for having the same properly surveyed and marked. With our limits distinctly defined in that quarter, and all difficulties at an end, settlers will push rapidly into that part of the country; and every tree felled, and every farm cleared on the upper part of the St. John, or its tributaries, whether by Englishmen or Americans, will add so much to the resources, prosperity, and consequent wealth of this City, for which many bright days are yet in store."

N.B. Courier - Apr. 15, 1843 Museum. - It will be seen by an advertisement in another column that the extensive and valuable Collection of Dr. Gesner is now offered for sale and we understand that this interesting establishment, the result of twenty years' labour of its proprietor, is to be closed on the 1st of May. It will be a matter of much regret if the

Collection is to be broken up and removed from the city; we should like to see it in the hands of some public institution."

N.B. Courier - Apr. 15, 1843 and Nova Scotian - Apr. 24, 1843 and Royal Gazette - Apr. 26, 1843 ADVERTISEMENT: For Sale. Gesner's Museum of Natural History, Consisting of the Minerals, Fossils, Shells, Fishes, Reptiles, Birds, Mammals, and other objects of Natural History of Nova Scotia and New Brunswick, with a great variety from other parts of the world. Also coins, Indian and other relics, - and numerous rare and valuable curiosities, works of art, &c., from different quarters of the globe. The Museum is well arranged, each Specimen is numbered and described in a printed Catalog, and thewhole is in an excellent state of preservation. The number of specimens is 2,500. The Collection will be divided into five parts to suit purchasers. Catalogues may be had at the Museum, and will be forwarded to persons desirous to purchase. The price and terms of payment will be moderate. St. John, 15 April A. Gesner The publishers of the Nova Scotian and Times at Halifax, and the Royal Gazette and Sentinel at Fredericton, will please insert the above twice."

N.B. Courier - Apr. 15, 1843 Gesner's Museum of Natural History, is open every Monday, Wednesday and Friday, from 12 to 4 p.m."

S.J. Loyalist - Apr. 30, 1843 Dr. Gesner's valuable museum of Natural History is offered for sale."

N.B. Courier - Aug. 5, 1843 Mechanic's Institute. - We are happy to hear that the liberal spirit manifested in the purchase of the Gesner Museum, and in placing it for public benefit, wehad almost said, free of charge, at the Hall of the Mechanics Institute, is duly appreciated on the part of the citizens and strangers, an increased number having visited the establishment this week. This collection embraces the Natural History of the British American Provinces, almost complete, and contains, besides, many foreign specimens of much interest, which are daily increased by contributions of friends to the Institution. It affords us pleasure to state, at the same time, that we are informed that an elegant saloon is nearly completed at the Hall for the purpose of holding a suite of conversational parties in the course of the present month, in order to raise funds for the liquidation of the overhanging debt, and for the subsequent re-establishment of the Schools of the Institution, the enlargement of its library, and a much-needed increase in apparatus suitable for a valuable course of

Novascotian - Aug. 14, 1843 Scientific. - The purchase of Dr. Gesner's Museum appears to have awakened the energies of the St. John, N.B. Mechanics' Institute to unwonted activity. Its library is enlarging, and its debt is in a course of liquidation. That Institution is doing more for oursister city than are all its Banks and other establishments which the avaricious have devised with the view of extracting money from the poor man's pocket and conveying it to the coffers of

S.J. Morning News - Feb. 22, 1843 Geological Report. - We beg to acknowledge the receipt of Doctor Gesner's Report, for 1842, published atthe Courier office. We shall review the Report, and pronounce an opinion upon it Friday."

S.J. Loyalist - Feb. 23, 1843 Dr. Gesner's Geological Report. - We have been favored with a new series of this work just published by Mr. Chubb. The work is neatly got up and reflects creditboth on the author and publisher; it is lucid, comprehensive, and entertaining, and should find a place in every library in the Province."

N.B. Courier - Feb. 23, 1843 and Miramichi Gleaner - Mar. 6, 1842 Report on the Geological Survey of the Province of New Brunswick, with a Topographical Account of the Public Lands, and the Districts explored in 1842. ByAbraham Gesner, F.G.S., Provincial Geologist, &c. The report of the labours of the Provincial Geologist, in the last season, has been laid before the Legislature, and is more interesting, if possible, than that of any former year. In addition to the Geological Survey, which appears to have been conducted in a careful and scientific manner, the Topography of the country under examination has been strictly noted, with a view to the formation of settlements, in accordance with the liberal policy of the Provincial Government. Gratified as every lover of the country must be at the earnestness which seems to characterize the endeavours of the Legislature to bring about a healthy state of public affairs, no less pleasure will be afforded in the contemplation that our fertile lands of almost boundless extent, and our vast mineral resources lie open for the industrious settler, when the restored prosperity of the Province shall again offer him an inducement. The Tobique River district, which has been hitherto but imperfectly known, is found to be one of great fertility of the soil, and of extensive capability for agricultural purposes, and yet remains ungranted. To use the words of the Report, ""the whole surface of the country, in the direction of the Tobique River, from its mouth to the distance of eighty miles northward, is capable of the highest degree of cultivation; the soil is equal to, and sometimes surpasses the best kinds I have seen in the Province."" ""Along the whole course of the stream, there are excellent alluvial soils, covered with the elm, balsamic poplar, ash, alder, &c.; wild hay is abundant. Besides these, we found indigenous grape, wild plums, currents, gooseberries, mint, rhubarb, and onions, with all those plants which only flourish on the richest soils."" - The bringing to light, from actual observation, the capabilities of so vast an extent of Territory as is occupied by the Tobique and its tributaries, for the purposes of immediate settlement, and placing them before the public in a manner by which their importance may become generally known, is ample recompense to the country (if the value of the service were doubted), for the expenses of the survey. The Restigouche River has likewise been the subject of research, from its mouth to the portage which separates it from Grand River, a tributary of the Saint John. The district examined in the vicinity of this river, as we learn from the report, abounds in marl and limestone, and notwithstanding the lands are mountainous and broken, the soil in general is good, and where cultivated, produces excellent crops of grain. An examination of the Aroostook country and the territory of the upper Saint John appears also to have come within the author's instructions, and, accordingly, in the Topographical part of the report, we find a glowing description of the Grand Falls of the majestic Saint John, which, having collected the waters of its numerous tributaries into a beautiful and expanded basin, launches them forth thro' a rocky gorge, three quarters of a mile long, and averaging but two hundred and fifty feet in width, until they reach another basin, one hundred and sixteen feet below the former, where the river resumes its natural state. The Geological examinations of the last season have embraced a tract of country, extending from the River Saint John, between Woodstock and Madawaska, to the Bay Chaleur and the Restigouche. The principal rocks of the district were found to be argillaceous and calcareous slates, limestones, sandstones, and conglomerates of the transition series, penetrated by numerous dikes and veins of trap. About midway, between Woodstock, on the south, and Dalhousie, on the north, mountains of granite and other rocks of igneous origin appear. These rocks are surmounted at Eel River, near Dalhousie, by red sandstone, red marl, limestone and gypsum. Copper, lead, manganese, and iron ores have been discovered, - Coal has been found at the mouth of the Restigouche, at Mission Point, and at Point Le Nim, four miles above Dalhousie. We recommend to our readers a perusal of the Report, for a detailed account of the explorations of the season, of which our limits at present compel us to give but a very

N.B. Courier - Feb. 23, 1843 Receiver General's expenses... Doctor Gesner, advance on account of Survey of Tobique River and Valley ... œ75 0 0Doctor Gesner, towards exploring Mechanics' Settlement ... 75 0 0 Doctor Gesner, advanced to him per authority on file, (towards Surveying Tobique River and Valley) ... 75 0 0 It will be observed ... that the amount advanced to Dr. Gesner, œ75, must have been connected with a Topographical and Geological Survey, not authorized by the Legislature, and not for any Survey of vacant Crown lands..."

Codes: GEOL / IDX_Names: Geology - General;
Morning News - Feb. 27, 1843 Geological Report. - The Annual Report of Dr. Gesner, on the Geological Survey of the Province, with a topographical account of the public lands explored in1842, has been politely placed in our hands. It occupies about 90 pages of octavo, and reflects credit upon the publishers. If we may be allowed to judge, from a hasty perusal of the work, the information it contains is of much importance to the Province. The first part embraces a topographical description of the upper part of the St. John, and the Tobique, and Restigouche rivers; the latter are represented as being noble streams, passing through an uninhabited but fine agricultural country. The mind of the writer appears to have been fully occupied in his employment, for scarcely an object around him, in the field of nature, has escaped his observation. His description of the rivers, lakes, waterfalls, mountains, valleys, etc., will be read with much interest. The general features of the country, the character of the soil, with the means for its improvement, and the facilities of internal communication, are also brought into notice; and they are such, that from being made known, they will doubtless be improved. At the close of the topographical part of the report, a brief account is given of the public lands fit for settlement in each county, and in such a manner, as to afford valuable hints to persons desirous of pursuing agriculture for a livelihood. The second part of the report contains an account of the geology of the country explored and describes its valuable minerals; among them are coal, iron, copper, etc. The mention made of limestone, gypsum, marl and other substances, that might be, according to the writer's views advantageously employed in agriculture, are worthy of consideration; and we would advise our friends in the country to read this part of the work with care. In the appendix, the use of lime in agriculture is recommended; and a plan of a kiln, with directions for burning, are laid down for the benefit of the farmer. In the Geological part of the report, whole mountains, composed of corals and shells, are described as having been, by some strange revolution in nature, raised up from the ocean, and changed into solid rock. Judging by the huge names given to these relics of olden times, we should think they were very curious things indeed, and the doctor's description of them, makes one almost fear the hard fate of being turned into stone. We have not yet taken many steps in the science of geology, and therefore do not condemn what we cannot understand. One of the advantages gained by the publication of this report, arises from the fact of their making the resources of the country better known, both to its inhabitants and persons abroad; and in the performance of this public service, the ability and industry of the gentleman engaged in the work are very obvious. We recommend that it is a useful and valuable acquisition to the literature and

N.B. Courier - Jul. 22, 1843 The Gesner Museum, we are happy to learn, has been purchased of the late proprietor, Doctor Gesner, by several public spirited gentlemen (among whom appear conspicuously the Hon. the Chief Justice, and Hon. Messrs. Justices Botsford and Parker), and placed in the Hall of the Mechanics' Institute. The delivery took place at the Hall this morning. - The addition of this large and very excellent collection to that already in the Institute, will form one of creditable extent, and of much interest, and will no doubt be frequently visited by residents of this City, and every stranger of taste. - The prices of admission are to be made as reasonable as possible, in order that the advantages arising from it may be generally embraced. A small reduction in favor of Members of the Institute has been requested by the

Board of Directors, and acceded to by the shareholders."

S.J. Morning News - Jun. 21, 1843 The Gesner Museum. - This valuable collection is now removed to the Museum Room, in the Hall of the Mechanic's Institute, where it is being arranged by the late proprietor. The Stock, we understand, has all been subscribed for - and we are happy to find this extensive collection is to be retained in the City of Saint John."

S.J. Morning News - Jun. 23, 1843 New Work on New Brunswick. - We are glad to observe, that a new work on this Province is about to be published from the pen of Dr. Gesner. It is a little singular, that a book treating upon the topography and resources of this valuable Colony has not yet appeared, in such a form as to be generally useful in Great Britain, by directing the attention of able settlers and capitalists to the country. A work of this kind has been earnestly sought for, by persons abroad; and cannot fail to be highly advantageous, in making the capabilities of New Brunswick better known, even to her own inhabitants. The opportunities afforded Dr. Gesner as Provincial Geologist, have enabled him to explore every part of this valuable Province; and we are happy to find that the task is confided to a gentleman whose ability and industry are well known, and whose labour will no doubt be crowned with success."

Codes: GEOL / IDX_Names: Geology - General;
N.B. Courier - Jun. 24, 1843 and S.J. Loyalist - Jul. 15, 1843 ADVERTISEMENT: Prospectus of a New Work, Now Preparing for the Press, and to be Published at SaintJohn and in London, to be entitled: New Brunswick: With notes for Emigrants, by Abraham Gesner, Esq., F.G.S., &c., Author of ""Remarks on the Geology and Mineralogy of Nova Scotia."" -- A work containing an account of the Topography, Climate, Soil and Natural Productions of New Brunswick, forms a desirable object in Colonial literature. It is generally acknowledged that the historical sketches of certain districts of the Province, which have appeared from time to time, with all the merits they possess, do not supply a full description of the whole country in its present state, and the advantages it offers to a respectable class of emigrants from Great Britain. The numerous able works that have been written on Canada have been the means of introducing the extensive improvements everywhere seen in that Province, compared with which New Brunswick possesses equal advantages. - As the relief of the surplus population of the Mother Country and its transferation to the unoccupied lands of her Colonies is of national importance, the chief object of the above work is to supply a full and accurate account of the Province with a view to its improvement by British emigrants and British capital. During the last fifteen years, the author has explored every district of Nova Scotia and New Brunswick. The last five years have been devoted to making a Geological Survey of the latter Province. His attention has also been directed to Emigration; and from the opportunities he has had for obtaining information, his descriptions will be given from actual observations, and his remarks will be derived from practical experience. Besides adverting briefly to the History and Aborigines of the Colony, the work will contain an account of its present state, its climate, topography, agriculture, geology and mineralogy, fisheries and other resources, trade, statistics, and natural history, with remarks on emigration, and information for emigrants. The work will be neatly printed on about four hundred pages of large duodecima, and will contain a new Map of the Province, with views of the Grand Falls and other natural scenery. Subscription Lists will be opened in different parts of the Province. - The price of each copy to subscribers will be Ten Shillings. Publishers of papers who will give insertion to the above Prospectus six times, shall be entitled to receive a copy of the work. St. John, N.B., June 17, 1843."

S.J. Loyalist - Jun. 29, 1843 Doctor Gesner. - This gentleman managed to claw no less a sum of the Province money, during the past year, than œ239 7s. 6d. In the following novel manner:- He was employed to explore the Tobique, Grand, and Restigouche Rivers, which occupied him (Sundays included) 68 days; for which he charged one pound a day, as well as for three days writing his reports. He also charged 10s. Per diem for his son; this charge was reduced to 7s. 6d., so that his bill stood at œ1 7s. 6d. Per diem for himself and son, which was paid; when lo! He petitioned - what? Think you, the House of Assembly? No; but the Executive, for œ68 more - another pound a day! And what was more astonishing, he got it too! And that in the face of a declaration made by the preceeding assembly, that no money should be appropriated for the further prosecution of any such purpose. The Committee appointed by the House to report on this transaction found fault with the charge of four successive Sundays; but we treat that as an improper objection, and we think the public will coincide with us when we tell them that the good Doctor was hard at work on those days; one day ""ascending the St. John""; and another descending the St. John; another ""repairing canoes""; and the other ""encamped"", and therefore doubtless employed in boxing with the mosquitoes! - The other service for which the Doctor got œ75, was for exploring the Mechanic's Settlement. The Executive, in vindicating this double payment, stated that the ""laborious and difficult nature of the services which he had performed, were not compensated by the first allowance, &c. and it appearing that these services had been executed in the most satisfactory and efficient manner, the further sum of œ68 was subsequently allowed to him. Now what were these laborious services? Why to sit in a canoe while the Indians poled it along the shore in ascending, land a few places and look at the soil, climb a hill or two and survey the adjacent country, and then sit in the canoe and float down again! and for this His Excellency and his advisers, - or some of them - paid the sum of œ185 7s. 6d. in defiance of the express declaration of the body in whose hands are placed the control of revenue; and at a time, be it remembered when His Excellency refused to issue warrants for the Bye Road appropriations, because there was no money in the Treasury!! As to the efficiency of the exploration - although the Report reads well - we may probably take Eel River for an example. On Doctor Gesner's recommendation a number of poor families were sent to that branch of the St. John to settle. He described the low land on the margin of that stream, as being beautiful interval, well adapted to agricultural purposes; when it is nothing but a floating bog, which rises with every freshet, and sinks as the waters fall! and the upland in the rear is a steep ledge of rocks almost inaccessible. - We are surprised that we have as yet seen no account of money paid the good Doctor for exploring the celebrated Bat's Cave."

Novascotian - May 1, 1843 Report. - We have received Dr. Gesner's ""Report on the Geological Survey of the Province of New Brunswick, With a Topographical Account of the Public Lands and the District explored in 1842."" The report occupies 84 pages octavo - We shall refer to it at another time."

Novascotian - May 1, 1843 Gesner's Museum, St. John, is offered for sale.The collection of minerals &c. is a very good

Codes: GEOL / IDX_Names: Geology - General;
S.J. Morning News - May 5, 1843 Gesner's Museum. - This valuable and interesting collection of Dr. Gesner's, has been offered for sale by its proprietor; and we are informed that His Excellency the Lieutenant Governor, the Chief Justice, Judge Parker, Judge Botsford, and a number of other gentlemen, have offered their assistance in purchasing the museum, and placing it in the Mechanic's Institute, where there are extensive apartments for its reception. We have seen the collection, and believe that it surpasses any in the British Provinces. It should never be allowed to be broken up, and sent to a foreign country. There is scarcely a town or village in the United States without its Museum, and surely the times are not so hard, that we are compelled to ship off all our sources or recreation and amusement. Who is there among us that will get up a joint stock company, and set the matter at rest; it only wants a beginning. We will venture to affirm that after the collection is gone, (especially if it should be sold in the United States) that there will be enough to cry. It is a poor reward to a man of science, to send his labours away. We would as soon think of selling the press of the Morning News to the Americans, as to give up to them the only Museum in the city."

N.B. Courier - May 6, 1843 The Museum of Natural History will remain open a few days longer. Admission every day (Sunday excepted), from 12 to 4 p.m."

N.B. Courier - May 6, 1843 Dr. Gesner's Collection, it has doubtless been observed with regret, has been recently advertised for sale, and we learn that a probability exists of the greater portion of it being removed from the city. It would indeed be a source of much sorrow if such should be the case, especially when the Hall of the Mechanics' Institute offers so valuable and commodious a place of deposit, and when a little exertion on the part of a few individuals would retain it here. We understand, that His Excellency the Lieutenant Governor, His Honor the Chief Justice, His Honor Judge Botsford, His Honor Judge Parker, The Hon. Mr. Hazen, and several other gentlemen of distinction, impressed with the value of the Collection, have expressed their willingness to aid in any plan by which the object may be attained; we therefore strongly entertain the hope of seeing this very interesting collection of the Natural History of New Brunswick yet kept within our borders, and placed in the Hall of a popular institution."

Novascotian - May 15, 1843 Gesner's Museum. - This valuable collection of Natural History and Curiosities has for some time past been offered for sale, at a price far below its value, and which will afford its talented collector but small remuneration for the years of toil and heavy expenses he has incurred in arranging it."

St. Andrews Standard - Feb. 12, 1845 Geology of Canada.- In the Canadian Assembly on the 17th ult., Mr. Attorney General Smith gave notice of a motion for the House to go into Committees at an early day to consider the propriety of giving a further sum for the completion of the Geological Survey of the Province. The Government intended to propose from œ1500 to œ1800 a year for four or five years as the House might determine."

Weekly Observer - May 25, 1845 Hampton Mechanics' Institute. - ..... On Thursday the 27th of February, George Otty, Esq., of this City delivered an able lecture on Geology......... - New Brunswicker."

N.B. Courier - May 23, 1846 Mechanic's Institute of St. John Annual Report. -... The Directors regret to say that the Gesner Museum does not receive the patronage it deserves; the care andconstant exhibition of these excellent and very interesting specimens of Natural History, Mineralogy, &c. have been attended with a loss to the Institute during the past year of œ18 17s 6d."

N.B. Courier - May 23, 1846 Mechanic's Institute of St. John Annual Report. -..... The Directors regret to say that the Gesner Museum does not receive the patronage it deserves; the care andconstant exhibition of these excellent and very interesting specimens of Natural History, Mineralogy, &c. have been attended with a loss to the Institute during the past year of œ18 17s 6d."

Novascotian - May 24, 1846 Mechanic's Institute. - The Mechanics' Institute was visited on Tuesday last by a distinguished French Gentleman, who came passenger in the Britannia, and wason his way to the United States, for the purpose of taking a tour through that country for Geological observation. He left his address at the Institute as follows: Edouard de Perneuil, President de la Societe Geologique de France. He expressed himself highly pleased with the

Geological specimens in the Institute, particularly those presented by Mr. Gesner, and our young and talented countryman, Mr. Dawson. He also intimated that he should return to Halifax, and take a tour through this Province. His Honour Judge Bliss, we understand, has presented to the Institute an Ostrich Egg, to be deposited among the curiosities of the Museum. -

Codes: GEOL / IDX_Names: Geology - General;
Weekly Observer - Dec. 25, 1849 Mechanics' Institute. - Professor Johnston gave an abstract of his Report on the Agricultural capabilities of the Province, on Friday evening last, to an overflowing and highly gratified audience. He commenced by exhibiting and explaining a Geological Map of the Province, which had been prepared under hisdirections, from Dr. Gesner's surveys, the returns in the Crown Land Office, and his own and Dr. Robb's observations. He next exhibited an Agricultural Map, showing, as far as our present knowledge extends, the various kinds of soil in the Province - these he divided into five classes; they form, however, three great divisions, which may be classified as good, middling, and bad, - each class containing Five Millions of acres. He then went on to compare the returns of produce, the weight, quality, and market price of the various articles raised in the Province, with like returns from Canada, New York, and Ohio, and found that in each of these particulars ours excel the others. The returns being in each case derived from the same sources, viz., Reports of Agricultural Societies, and statements from intelligent farmers from different localities, there is no reason to suppose that they do not equally approximate to the truth. We must confess that we were not prepared to expect such a favorable result; but, in such hands, the investigation was necessarily conducted on correct principles, and impartiality. We must, therefore, bow to the decision, and we feel quite pleased that our own New Brunswick has been pronounced by a competent judge as entitled to take a front rank among the nations, as an Agricultural country. There has been a good deal of talk about annexation lately. If there is to be annexation, we go for annexing the United States. Notes of the lecture were taken by Geo. Blatch, Esq., and an able and correct Report may therefore be expected. It will probably soon be published."

Morning News - Dec. 28, 1849 New Brunswick. - Its Soil - Climate - and Agricultural capabilities - Who is Professor Johnston? - Our Government - State of the Country - Annexation. - We purpose now to notice a few of the chief points of Professor Johnston's lecture of last Friday evening. ... Professor Johnston stated that this Province had gone to very great expense in the prosecution of its Geological inquiries. The Reports of Dr. Gesner'sobservations had yearly been published. He found in the Crown Land Office at Fredericton cart-loads of manuscripts and pamphlets from various sources, bearing upon this subject, and for which he was indebted for much useful information - Yet, notwithstanding, there had not been a proper geological map, (such as the one he then exhibited) prepared by Dr. Gesner, or any one else, and without which it was impossible to convey a correct idea of the actual capabilities of the Province. He said he had travelled over this province, upwards of two thousand miles, had borne all sorts of hardships, and privations, as any one might naturally suppose from the wilderness journeys which laid before him - he had seen the farmers and lumbermen in their homes; and he was astonished to find how little the people valued their time, from the manner in which they lived. He said if the farmers in England were as indifferent to the true value of time as the farmers of this Province, they could not succeed at all. ""Let the morrow provide for itself"" appeared to be the Farmer's motto of New Brunswick. He said the life of the farmer here would not be an easy one if his farm was properly cultivated and attended to. ..."

Miramichi Gleaner - Jan. 2, 1849 Report on the Proposed Trunk Line of Railway, From an Eastern port in Nova Scotia,Through New Brunswick, to Quebec. Halifax, N.S., August 31, 1848. (includes some geological observations....

Codes: GEOL / IDX_Names: Geology - General;
Miramichi Gleaner - Jan. 7, 1850 An Address. - Delivered before the Mechanic's Institute at St. John, on Friday evening Dec. 21st, 1849 by Professor Johnston. - [Reported by G. Blatch, Esq., Barrister at Law] - ... In looking at the agricultural capabilities of any country, it is of the greatest consequence to a person taking a general view of it, to have an idea, before hand, of what is the Geological structure of that country. In my former address in thisplace it will be remembered by those who were present, that I drew the attention of the audience to this point; that a knowledge of the geological structure of a country is of the greatest possible consequence, to enable any one to arrive at anything like general conclusions with regard to the agricultural capabilities of that country. When I tell you, that from an inspection of the geological maps of other countries, countries which I have not personally visited, I am enabled to judge of the agricultural capabilities of those countries, and not only to judge of those capabilities as a whole, but also to instruct others as to the kinds of husbandry most suited to the various soils of such countries, you will have an idea of the value of a knowledge of what is called the geological structure of a country; and this knowledge you may obtain by looking at geological maps. If you look at this Geological Map of the Province of New Brunswick now exhibited before you, (which I have prepared, to attach to my own Report on this Province,) you will see that there are various portions of its surface colored with different colors; and these colors represent the different species of rocks which prevail in the various districts of the Province. Now you all know, that if you dig beneath the surface of the earth at any place you will come at a lesser or greater depth, to the solid rock. The solid rock varies in species in various parts of every country, and Geologists have given different names to the various species of rocks, such as sandstone, trap, greywacke, limestone, and many others. This system of the various kinds of rocks constitutes what is called ""geological formation;"" and this geological formation or structure of a country is exhibited in maps by different colors, the various colors representing the various geological formations or species of rocks. The map now before you thus exhibits the geological formations that occur in the Province of New

Brunswick, and I have been anxious to embody in one map, all the information hitherto collected as to the geological formation of this Province, by previous investigations as well as by myself. Dr. Gesner has often addressed you from this place on this subject; he was employed for several years at the expense of the Province in making geological explorations of the country, and he published a series of reports of the results of his enquiries, which no doubt, contain many valuable facts and observations. But unfortunately, though those facts and observations are to a certain extent embedded in this map, yet it is still exceedingly incomplete. I have had all the available observations of Dr. Gesner, as well as my own observations and those of Dr. Robb embodied in this map; and although it is still incomplete, yet it will afford more information on the subject than has yet been obtained; and here I cannot help remarking, that a large amount of valuable information on this head is deposited is deposited in the Crown Land Office of this Province, and it seems to me surprisingly, that information for which such large sums have been paid by the Provincial Government, should up to this moment have lain hidden in a Government office. We have now noticed the fact of the various kinds of rocks; the next principle to consider is, that every rock with which we are acquainted when exposed to the action of the air, gradually undergoes a crumbling process; it becomes as it were, degraded, and is converted from a solid mass into minute portions of matter, which, by the chemical separation of the atmosphere and other combinations, in course of time, form gravel, mud, clay, sand, &c., and on the top of those materials eventually the soil is formed. - Now, soils are of various kinds, according to the nature of the materials from which they have been formed. You will see, on this map, between the broad red belt which stretches diagonally, and the patch of lighter red in the corner below, a large tract of surface colored grey; these colors represent different kinds of soils; and you will observe, that this large tract of land colored grey, is covered with loose materials forming a soil totally different from the red rock or sandstone. Therefore it is important in taking a general view of the agricultural capabilities of the soil and the quality of the rocks of which that soil is formed. The first chapter of my Report comprehends the study of the geological structure of this country, in relation to its agricultural capabilities and qualities of its various soils. I describe those qualities and capabilities; and when you read it, you will see that the Government, which in former years expended large sums of money in encouraging explorations and in endeavoring to make out the geological structure of the Province, have not only done a thing of great importance and service to the country at large, but have really laid out this money in a way which ultimately (and more especially would it, if the project had been satisfactorily completed) will repay itself, which will actively benefit the pockets of those who cultivate the soil of the country; because the knowledge thus obtained will hereafter enable them to know how the soil is composed, and how it can most advantageously be improved by cultivation. By this map you will be able to tell where good soil and where bad soil is to be met with; and it will thus be practically beneficial to proprietors and future purchasers of land. I have now briefly noticed the general description of the soil as demonstrated by the geological formation of the country; and I have thought it proper to begin my Report with this introductory chapter, as a preface to the rest of my

Miramichi Gleaner - Jan. 14, 1850 An Address. - Delivered before the Mechanic's Institute at St. John, on Friday evening Dec. 21st, 1849 by Professor Johnston. - [Reported by G. Blatch, Esq., Barrister at Law] - ... Now, if you look at the Geological Map of the Province, you will see a great stretch of the grey color between the two reds, and this grey district is called 'the coal field', because seams of coal occur here and there throughout that district. In some parts of the world these coal seams are very numerous, the coal is easily got at, and is very profitable production; as, for instance, in Cape Breton Island, in Nova Scotia, and in Great Britain. Dr. Gesner explored this tract of country, and indicated the localities where he considered coal might be found. It appears to me that it is important to enquire, whether, among these beds of sandstone indicated on the map, beds of coal may be found which are likely to pay for the working, and profitably to aid the industrial pursuits of the country. On this Geological Map I have marked, by black dots, all the places where coal has been actually found; and in my Report I have collected, both from the Reports of Dr. Gesner and from other sources, every observation that has been made as to the nature of the coal in this Province, and the probability of finding it in greater quantities; because the question of a supply of coal or fossil fuel is a vital question in reference to the agricultural capabilities of the country, and not merely a manufacturing or trading question; it is a question, indeed, of whether the country shall support five millions or only three millions of inhabitants. The difference is very striking indeed, it is the difference between producing fossil fuel from underground, and raising fuel on the surface of the land. France is an instance of this difference; forthough France possesses coal mines, yet about one-seventh part of the whole surface of that country is under wood, to furnish fuel for the people, even in that temperate climate. You will see, then, the great importance of the question in this colder climate; and I have therefore brought the question prominently forward in my Report, and have recommended an enquiry into the economical question, of how far it is likely that coal does exist, and that by exploration it may be found sufficiently plentiful and easy of attainment to be profitably useful. After doing this, I have considered other collateral topics in my Report, which I now pass over..."

Novascotian - Mar. 20, 1850 Lectures on Natural History. - On Monday evening Mr. Dawson will commence the Geological Department of his Course. This subject including a view of the Geology and Mineral Resources of Nova Scotia, will occupy the five concluding Lectures. Tickets for this department can be obtained at the Book Store of Messrs. A. & W.

Codes: GEOL / IDX_Names: Geology - General;
Novascotian - Aug. 4, 1851 To The Shareholders Of The Halifax Gas Company. - Our attention having been called to a letter published in the Colonist newspaper of the 22nd inst., signed ""John E. Fairbanks"" in which he states he ""only

regrets that a satisfactory arrangement had not been made with the Halifax Gas Company in the outset which under his (Gesner's) sanction he endeavored to effect"" and also adds that ""he had failed in his endeavors with all parties to bring about a compromise and prevent litigation."" These statements we have read with astonishment, they being so entirely at variance with truth, as far as this Board is concerned, no such overtures having been made to us either at the outset or since. We, therefore, feel called upon publicly to declare that no such proposals have been submitted from Mr. Fairbanks, nor his friend Dr. Gesner, or from any other person. Conversations may have taken place between Mr. Fairbanks and some members of the Board, but no proposition to effect a compromise or prevent litigation, has ever been submitted to the Directors. The first information we had that Dr. Gesner claimed a patent for a new discovery, alleged to have been made by him for making Gas, was after the Letters patent had been signed by the Attorney General (our President,) and delivered to him. This was in February, 1850. We give the patent in his own words which state ""What I claim as my invention and discovery, and desire to secure by letters Patent, is the use of compact and fluid, Bitumen Chappapose, or mineral Pitch, for the production of Illuminating Gas, instead of Coal Oil or Rosin, or any other substance heretofore used for that purpose,"" and gives him the right to use these substances in his oven retorts, by means of which he declares he can produce Gas. The next measure we heard of was a Bill introduced by Dr. Gesner and his friends at the then Session of the Legislature, to Incorporate the Kerosene Gas Company; thus were we taken by surprise, and as various reports were industriously circulated, well calculated to injure and depreciate the property of the Halifax Gas Company, we felt it to be our duty to expose their fallacy, and make the Shareholders fully acquainted with the state of their affairs, and prevent any of them parting with their property at less than its real value. We therefore published our report of the 5th March, 1850. This seems to have excited the ire of Dr. Gesner, and we have since met with nothing but a determined and vindictive hostility from him, as exhibited in his frequent slanderous attacks published in the various newspapers of the City, both under his own and assumed signatures, to none of which we have thought it necessary to reply. The Suit or litigation as Mr. Fairbanks is pleased to term it, is all on the side of Dr. Gesner. We ordered a sample cargo of Coal from Mr. Allison this spring, without knowing that Dr. Gesner had set up any pretensions to its being his property, and stated our intention to our Shareholders previous to doing so in our report of 7th March, 1852. At the annual meeting in April following, we announced that this Sample Cargo of New Brunswick Coal had been ordered, which met with the approbation of the Shareholders present. The cargo was accordingly shipped by Mr. Allison, and consigned to his Agents in this city, to be delivered to the Halifax Gas Company at a fixed price. A few days before its arrival, we heard that Dr. Gesner intended claiming it as his property, and would repleven it on arrival, but as we had nothing to do with the cargo until it was delivered to us, we took no notice of it. On arrival Mr. Allison's agents delivered the coal to us in accordance with our agreement. No legal measures having prevented its coming into our possession. We therefore received and paid for it in conformity to the terms upon which it had ordered, supposing Dr. Gesner had abandoned his intention to repleven from his inability to swear the property was his. Soon afterwards he commenced an action of trover against the Company - damages œ500, the pretended value of this small cargo of coal, and which he declared to be his property, although the Master of the Rolls at Fredericton had decided to the contrary; and this suit is still persisted in, notwithstanding Mr. Fairbanks very great anxiety to bring about ""a compromise and prevent litigation."" Without attempting to depreciate Doctor Gesner's mode of manufacturing Gas, his method is of no service to the Halifax Gas Company, nor have we any desire to avail ourselves of any of his important discoveries. - We heard of the New Brunswick Coal as superior for making Gas as early as the autumn of 1848. - and in January, 1849, nearly 12 months before Dr. Gesner applied for a patent, we opened a correspondence with Mr. Edgett to furnish us with a sample for the purpose of trial. In August, 1849, the St. John Gas Company used it at their works, and found it superior Coal for Gas purposes - and in February, 1850, Doctor Gesner obtained his patent for a new retort discovered by him, by which he could produce illuminating Gas from asphaltum; although various other modes of making Gas from the same substance have been in use many years. His Retort we have not used, nor do we wish to do so. The material, whether Coal or Asphaltum is as free to us or others for making Gas as water or any other natural production, so long as we do not infringe upon any patented machinery in its manufacture. It will be seen that Doctor Gesner has selected the Halifax Gas Company to defend this vexatious suit, instead of Mr. Allison or his Agents, who are the real defenders. We have, however, no fear of the result - the evidence brought before the Master of the Rolls in the other Province, shewing clearly that Doctor Gesner has not the shadow of a claim to the Coal, nor can he obtain a single bushel except by purchase from Mr. Allison, the same as ourselves, although a heavy expense will necessarily be incurred by Mr. Alison in collecting similar evidence for this Province. We believe the trial will likely end in the same manner as one lately brought by the same party in Albert County, when on the day of trial no one appeared to prosecute. In the mean time a strong effort will be made by Doctor Gesner and his friend Mr. Fairbanks, to obtain the true objects sought after. We have been induced to make these explanations in consequence of the statements made by Mr. Fairbanks, already referred to, which are entirely incorrect; but as we have neither time or inclination to seek notoriety by a newspaper controversy with persons interested in promoting their own selfish schemes at the expense of the Halifax Gas Company, we shall reply to none of them through the newspapers, but manage the large and valuable property entrusted to our care, to the best of our ability, and we hope to the approbation of each of our numerous Shareholders. The City newspapers which have been circulating Doctor Gesner's various letters have many patrons among the Gas Company, we presume they will copy this letter in their columns, that those of the readers who are Shareholders may see both sides. James B. Uniacke, President J.H. Anderson, W.A. Black, James Donaldson, Andrew McKinlay, John Naylor, James Tremain. John Tremain, Secretary. July

Novascotian - Sep. 8, 1851 The World's Fair. - We see no specimen of coal from Canada and if the absence of such correctly leads usto conclude that no basin of that mineral has yet been discovered in the province, we may assure the Canadians that they will some day be made aware of the importance of connecting themselves more closely with New Brunswick and Nova Scotia, where this mineral is abundant. ... The sister Province of New Brunswick has not been entirely idle amid the general excitement to contribute to the show of industry of all nations; but this is all we can say, inasmuch as the samples of iron ore, manganese, plumbago, and pitch coal, which compose her entire list of mineral specimens, are most paltry as an index of the mineral wealth which really exists in that fine province. New Brunswick is somewhat larger than Ireland; the greater part of her soil is fertile, and is covered with fine forests. Two-thirds of her boundary line are formed by the sea, and, as a consequence of these conditions, the energies of her inhabitants have been absorbed by timbercutting and by fisheries. She possesses, however, vast stores of coal, of ore, and of stone, applicable to building and the arts, and as soon as the temptations to 'lumbering' (cutting timber) and fishing on the small scale diminish before the advance of population and the demand for produce of more skilled labour, than will the star of New Brunswick take its place amid the more solid and valuable jewels of the chaples which adorns the brow of our Imperial Victoria. ..."

Nova Scotian - Jan. 1, 1855 ADVERTISEMENT: In Preparation, and to be published in 1855. Acadian Geology: A Popular Account of the Geological Structure and MineralResources of Nova Scotia and portions of the neighboring Colonies, By J.W. Dawson, F.G.S., &c. The above work will consist of about 300 octavo pages, and will be illustrated by a large Geological Map, Sections, and Figures of Fossils. It will include a large mass of unpublished notes, referring to Nova Scotia, Cape Breton, Prince Edward Island and parts of New Brunswick, the substance of sixteen papers contributed by the author to the Geological Society of London and other Scientific Societies, and notices of the more recent discoveries of

other Geologists. These materials will be arranged in such a manner as to present to the general reader a complete view of the structure of Nova Scotia and the neighboring districts, as far as at present known, with its relations to the facts and principles of general geology, and to the present and prospective value of the useful minerals. With the view of ascertaining the number of copies likely to be required, subscription lists will be left with Messrs. A. & W. MacKinlay, and E.G. Fuller, Halifax; Messrs. J. Dawson and Son, Pictou; Mr. A. Lawson, Yarmouth; Mr. W.H. Crawford, St. John; Mr. G.T. Hassard, Charlottetown. Price to subscribers, 9s., payable on delivery of the work. Price after publication, 10s. dec 12"

Royal Gazette - Feb. 11, 1857 King's College. - Lectures for Lent Term.- ... By Professor Robb. Geology - Nature of Rocks constituting the Earth's crust; essential Minerals forming Rocks; Fossils, their nature and value; Petrifaction; Paleontology; Classification of Rocks according to origin and age; Aqueous, Igneous and Metamorphic Rocks; Stratification, horizontal and inclined; Joints and Cleavage; Dip and Strike of Rocks; Geological Maps and Sections; Denudation; Origin of the actual Surface of the Earth; Value of Mineral matter and Metallic Ores; Rocks and Fossils of the Different Epochs; Application of Geology to Agriculture, Mining, Engineering; Geological structure of different Countries;

Morning News - Apr. 12, 1858 The Geological Survey. - The Editor of one of the little opposition papers, printed in Prince William street, has grown quite melancholy because the House has been prorogued without any provision being made for developing ""the mineral wealth which lies hidden beneath the soil."" Whatever may be the amount of riches contained ""beneath the soil"", and about which he seems so anxious, the Government acted wisely in not asking the House for agrant for geological purposes at the present time, as the surplus money of the province can be well employed in developing the ""wealth"" above ground, without spending any of it underneath. A Geological Survey to be thorough would occupy several years, entail on us an enormous expense, and, when completed, we would be unprepared to reap any benefits from it. There is no saying what such a survey would cost; but the experience of Canada must be a lesson to us. For several years past one of the items in every budget has been ""£10,000 for the Geological Survey"" of that Province."

Morning News - Feb. 17, 1858 Geological Survey. - The New Brunswicker thinks there ought to be a Geological survey of the Province made. Perhaps we had better send for Dr. Gesner again! The Editor is of opinion that certain parts of the Province abound in mineral wealth, of almost every variety, and that it only requires the exploration and labour of a Geologist to point out the treasures. We again ask, how is it that the Provincial Geologist who had been digging and delving for years at £600 a year, never brought any of these wonderful secrets to light? If the old Government folks were in office we should think that our contemporary was trying to find employment for somebody. But the present government are not to be bamboozled by persons desirous of a loaf."

Morning News - Jul. 28, 1858 The skeleton head, tusks, etc., of an Elephant, were lately discovered by some men ditching at the Bay de Verte marsh."

Morning News - Jan. 19, 1859 The Gesner Museum. - Mr. Editor. - In reference to Museum part of your Gesner article you are in error,and consequently you make the Directors of Institute responsible for what they were never guilty of. The Museum is the property of the Institute, and cost it nothing. The Doctor was in debt to quite a number of our citizens, and prior to his leaving wished to dispose of his Museum to pay them; he was anxious that the Institute would take it for £1000, but they declined. The next step was to divide it into shares of £5 each. He paid the most of them that way. He owed -- £100 and -- £100 more; and the trouble with them was what to do with it; they made arrangements to get it into the Institute, and shortly after one by one made a present of their shares, and that which was asked £1000 for, was obtained by the Institute for nothing. Thus the Directors, in place of being censured, are entitled to great credit, and also the share-owners for their liberality. This is the true state of the case. Your's, A.B. We are obliged to our correspondent for this ""true state

Miramichi Gleaner - Mar. 12, 1859 Report of the Northumberland Agricultural Society. - ... Mineral Resources. - No minute survey of the mineral resources of this County, by a properly qualified person, has yet been made. Little, therefore, is known of its mineral resources. About five miles below Chatham there is every indication of the existence of workable beds of coal; a small but perfect stratum appears in the cliff near Black Brook. ""Appearances,"" says Dr. Gesner, ""render almost certain that coal may be obtained here at no great depth from the surface."" On the South West, about eleven miles from Newcastle, coal appears on the south bank of the river. It is said to be but an inconsiderable stratum, belonging to one of the superficial beds noticed by Dr. Gesner. Coal has also been found on the Renous and Bartholamew's rivers, but very little is known as to the quality, or extent of the deposit. Whether Northumberland abounds with minerals of a valuable kind, or is entirely wanting in all such productions is a question which has still to be solved. The opinion of Geologists (who have visited the County, and travelled over its different easily accessible districts) is - that the former is the case, and that coal, and other fossil bodies, are abundant. ..."

Codes: GEOL / IDX_Names: Geology - General;

Morning News - Sep. 12, 1859 Geological Surveys in the British Provinces. - A Canadian correspondent of the Portland Advertiser writes that Sir Wm. Logan's new Geological Map of the British Provinces is far advanced towards completion. It extends north to James Bay, or the south point of Hudson's Bay; east to include Newfoundland; south to embrace the Pennsylvania coal field to the mouth of the Delaware River, and west to include the Red River of the north. The only blank spot is Maine. Prof. Dawson has given a geological chart of Nova Scotia. Prof. Robb is compiling one for New Brunswick; Prof. Hall, of New York, is at work on the southern portion, while the survey of Massachusetts and the other states afford means for filling in their geology. Sir William has traced the Devonian rocks, and the belt of limestone from Gaspe to Long Island Sound along the northern and western frontier of Maine, and through New England, and carboniferous formations in New Brunswick and Nova Scotia."

Morning Journal - Feb. 19, 1860 Professor Bailey's most admirable lecture is completed in our present issue. We need not point out to our intelligent readers how grand and elevating are the views of creation and of the primeval history of our own Province which it discloses, period after period, until it became fit for man's abode; nor how important it must be to the students of the University to receive such instructions - nor, lastly, how beneficial to us in a moral, scientific material and economic point of view, must be a thorough Geological survey, which can be carried on step by step, according to our means. It is quite too bad that no arrangements were made for having the work carried on last summer and fall as in

New Brunswicker - Apr. 4, 1861 Professor Robb, of King's College, died suddenly on Tuesday afternoon."

Morning Freeman - Apr. 4, 1861 Dr. Robb, one of the Professors of the University, died on Tuesday after a short illness. He was said to be a man of considerable attainments, and his report to the Agricultural Board, which has been recently published, proves him to have been a man who could turn his knowledge to excellent account. -- The University it appears is now in an extraordinary condition. The ex-president Dr. Jacobs has been dismissed. Dr. Robb is dead. Professor Jack it is said has resigned, and the President awaits judgement on a variety of charges preferred against him, and a great number of pupils have left the establishment."

N.B. Reporter - Apr. 5, 1861 Robb obit..."

New Brunswicker - Apr. 6, 1861 House adjourned at 4.10 to attend Dr. Robb's funeral."

Codes: GEOL / IDX_Names: Geology - General;
N.B. Courier - Apr. 6, 1861 Death of Dr. Robb. - It becomes our painful duty in this issue of the Courier, to record the demise of Dr. J. Robb - a gentleman who for a long period occupied, in a manner alike creditable to himself and the Province, the position of Professor in King's College, Fredericton - who departed this life on Tuesday, 2nd inst. In his demeanor, Dr. Robb was a perfect gentleman, and was revered and respected by all who had the good fortune to make his acquaintance; as a scholar and a man of science, he had few superiors, while his humane and benevolent disposition endeared him to all with whom he came in contact. In every useful work, he was always found to be an active participator. He occupied from the time of its establishment up to the period of his death, the important position of Secretary to the Board of Agriculture, the duties of which he discharged in an able manner. The recent report of the Board, noticed in another column, fully attests to this. The death of Dr. Robb will be to the Province at large an irreparable loss; for, we believe, with a contemporary, ""that he possessed a more extensive and accurate knowledge of the Geology and Mineral resources of this Province than any man now living."" We extract the following just tribute to the memory of departed worth from the Head Quarters:- The deceased was the eldest son of Charles Robb, M.D., of Sterling, Scotland, and was born on the 2nd of February, 1815. - After studying in various Scotch Universities and taking his Medical degree at Edinburgh, he travelled on the continent of Europe, and resided for 5 some time at Paris for the purpose of making himself thoroughly conversant with the various branches of his profession. In 1837, his extensive and accurate knowledge of the Natural Sciences secured him an appointment in King's College, Fredericton, where he labored most zealously and faithfully in the discharge of the various duties in his Professorship. Many of his old pupils will grieve that he has been thus early cut off in the prime of his life and usefulness; and that our Provincial University has lost his able services at a period when his experience and sound judgement would have been particularly valuable. His vigorous intellect and untiring industry enabled him to take a master's grasp of the various sciences entrusted to his professional teaching; and his power and facility of imparting in a thoroughly scientific manner, the fundamental and guiding principles upon which were based his own vast stores of information, will long be remembered by those who had the privilege and advantage of attending his lectures. He possessed a more extensive and accurate knowledge of the Geology and Mineral resources of this province than any man living. To him we are indebted - for our University Museum, many of the specimens for which we were collected by his own hands, and not few purchased at his own individual expense. In all matters connected with the advancement and prosperity of the Province, he was ever ready and willing to give his efficient aid and assistance, and his early removal may be truly regarded as a public calamity. He was a pure minded, noble and honorable man and a sincere and pious christian. As a friend he was generous, warm hearted, and uniformly kind and considerate. To him the ...?... or the needy never applied for advice or assistance in vain. At such time we forbear to intrude upon the sacred privacy of the afflicted family circle, to speak of his many virtues and endearing qualities as a husband and a father. He was beloved by many, respected and esteemed by all; and there are few whose loss will be more deeply felt, or who will be so long held in affectionate and grateful remembrance.""""

St. Andrews Standard - Apr. 10, 1861 Death of Dr. Robb. - It is with deep regret, we learn that Professor Robb, died suddenly at his residencein the University, Fredericton, on the 2nd inst. From an obituary notice in the ""Head Quarters"" of the 3d. inst., we take the following extracts:- The deceased was the eldest son of Charles Robb, M.D., of Sterling, Scotland, and was born on the 2nd of February, 1815. - After studying in various Scotch Universities and taking his Medical degree at Edinburgh, he travelled on the continent of Europe, and resided for some time at Paris for the purpose of making himself thoroughly conversant with the various branches of his 6 profession. In 1837, his extensive and accurate knowledge of the Natural Sciences secured him an appointment in King's College, Fredericton, where he labored most zealously and tastefully in the discharge of the various duties in his Professorship. Many of his old pupils will grieve that he has been thus early cut off in the prime of his life and usefulness; and that our Provincial University has lost his able services at a period when his experience and sound judgement would have been particularly valuable. He possessed a more extensive and accurate knowledge of the Geology and Mineral resources of this province than any man living. To him we are indebted - for our University Museum, many of the specimens for which we were collected by his own hands, and not few purchased at his own individual expense. He was a pure minded, noble and honorable man and a sincere and pious christian. As a friend he was generous, warm hearted, and uniformly kind and courteous."

St. Andrews Standard - Jul. 3, 1861 We learn that the University Senate have during the present week, made the following appointments:- ...Mr. Bailey, of Cambridge, Mass., to be Professor of Natural Science, in the place of the late Dr. Robb... [Col. Empire"

N.B. Courier - Jul. 6, 1861...Mr. Loring Bailey, of Harvard University, Cambridge, Mass., to be Professor of Chemistry and Natural History. ...Mr. Bailey, the Professor of Chemistry and Natural History, is a young man of more than ordinary ability, at least, he bears the very highest recommendations form Harvard University as to scientific knowledge, general ability and high scholastic attainments. He is a son of the late Professor Bailey of West Point Military Academy, the

N.B. Courier - Jul. 6, 1861 The Late Dr. Robb. - From the Encenial Address delivered by W. Brydone Jack, D.C.L., President of the University of New Brunswick, at the close of the Academic term, on the 27th ult., we extract the following, which refers to the late lamented Dr. Robb. We would willingly insert the whole address did space permit, as it is an able production:- There is one melancholy theme on which I have as not yet touched, but which I feel not to be passed over in silence on an occasion like the present. One seat I see vacant that last year was filled, - one heart that ever throbbed warmly for our welfare had ceased to beat, - one head full of ripe scholarship and profound science lies lowly in the dust. The death of Dr. Robb has no doubt been keenly felt by many of you as the loss of a warm friend or valued instructor:- to me it has been the removal of more than a brother. For upwards of twenty years we had been associated in kindred pursuits without the perfect harmony of our daily intercourse ever being disturbed. He was a true friend and a cheerful and instructive companion. Naturally endowed with a strong and vigorous intellect and possessing powers of unwearied application, he had amassed vast stores of knowledge, which being orderly and scientifically arranged he could liberally draw upon whenever occasion required. He loved science for its own sake, and followed its onward march with neither slow nor faltering steps. His knowledge was thus ever progressive and always fully up to the standard of the day. A courteous manner and genial temperament, together with a quaint and playful humor with which he often enlivened his conversation, marked his intercourse with society, and endeared him to his more intimate acquaintances. Possessed of kindly feelings and ready sympathies, he was ever careful not to give wanton offense or wound the susceptibilities of others. Generous, warm hearted, and benevolent, the poor and needy never applied to him in vain; and to the diseased and suffering his professional advice and assistance were freely and cheerfully given, even when involving much inconvenience and trouble to himself. As a medical man, though avowedly not engaged in the practice of the profession, he enjoyed a deservedly high reputation; and I have heard many speak in the warmest and most grateful terms of the benefits they had derived from the exercise of his skill. As a Professor in this University, he was eminently qualified to give instruction in all the various branches of science entrusted to his care. His own knowledge of these was profound and systematic, and having himself had the benefit of a regular and scientific training, he possessed the happy forte of communicating and impressing his views in a clear, connected, and methodical manner upon his pupils. Being thoroughly imbued with the great principles of the Inductive Philosophy, he carefully and minutely scrutinized the value and bearing of every fact upon the results to which it pointed. But his labors were not confined to the lecture room. His extensive and varied knowledge of every section of the country enabled him to communicate much valuable matter to Professor Johnston for the Report of that gentleman on the Agricultural Capabilities of New Brunswick. To him we are indebted for the compilation of a Geological Map of the Province, which though necessarily imperfect, is the best guide we have on the subject. The university lies under the greatest obligation to him for the establishment of its Geological Museum, and for an extensive collection of the flora of New Brunswick. The latter and many specimens in the former are entirely due to his individual exertions, in the prosecution of which it was often necessary to spend not only time but money. or did he limit his attention to matters strictly professional; for one marked characteristic of his mind was a strong predeliction for the practical results of science. Accordingly, very shortly after the first introduction of the Electro-Magnetic Telegraph, we find him, in conjunction with Mr. Wilkinson, drawing up a report to the then Lieut. Governor, Sir William Colebrooke, on the mode of working it, and the expenses of its construction and maintenance, with a view to the establishment of a Line in this Province. Many members of the Fredericton Atheneum will long remember his labours in that Society, and the great practical value of the papers he contributed, whether on literary, historical, or scientific subjects. He was a member of several learned Societies and Associations in other countries, and to these he occasionally sent communications, but his eminently practical turn of mind repressed the desire, and did not allow the leisure to write much on purely scientific or speculative points. He was one of the most zealous in promoting the formation of the ""New Brunswick Society for the encouragement of Agriculture, Home Manufacture, and Commerce,"" and acted as its most efficient and responsible officer during the period of its existence. It was in a great measure, owing to his untiring exertions that the Fredericton Provincial Exhibition was attended with such happy success, and that such orderly arrangements prevailed in its several departments. His views and opinions had no small influence in establishing the present ""New Brunswick Board of Agriculture"" and the great ability and indefatiguable zeal with which he discharged the onerous duties of its Secretary up to the time of his lamented decease, are universally acknowledged. No wonder then that his death should be regarded as a public calamity; and on this Institution with which he was so long and honorably connected, the blow falls with peculiar severity. He is the first of our Professors whose loss we have been called upon to mourn while still engaged in the active discharge of the duties of his office. In the prime of his life and in the midst of his usefulness, it has pleased the Great Disposer of events to remove him from amongst us, and the sad occurrence cannot but forcibly remind each of us of the words of solemn warning - ""Be ye also ready."""

N.B. Reporter - Jun. 28, 1861 Mr. Bailey of Cambridge, Mass., to be Professor of Natural Science in the place of the late Dr. Robb."

Miramichi Gleaner - Nov. 16, 1861 Geological Surveys. - Several of the Provincial Journals are urging the propriety of instituting a Geological Survey of the Province. Some years since a petition to the Legislature was sent from this County, soliciting that a sum of money be appropriated for a Mineralogical and Geological Survey of the Province. It was favorably entertained a grant was allowed, and Dr. Gesner appointed to perform the work. The Survey continued for two or three seasons, and was confined to the Southern section of the province, but when it came to the turn of the Northern counties, the grant was discontinued, the Doctor dismissed, and this quarter of the Province left unexplored, though the petition for the grant originated in this quarter, and it was certainly admitted that in this section there is ample prospect that coal, copper, and other valuable deposits are to be found. We hope that Sir Wm. Logan, or some other person competent for the task, will be employed at an early period. We perceive that the Nova Scotia Government purpose to submit a measure providing for a Geological Survey of that Province, to the next meeting of the Legislature. We hope our Government will adopt a similar course, and as the last Survey terminated at our border that the next will commence there, as in all fairness it should."

Codes: GEOL / IDX_Names: Geology - General;
Morning News - Sep. 30, 1861 ADVERTISEMENT: Geology. A Private Class, for instruction in the above science, two evenings in the week, will be opened at the High School, on Tuesday Evening, 15th of October next, at 8 o'clock. A Cabinet of over 9000 specimens of Fossils, Minerals, &c., and a set of Diagrams and Models will be open to the inspection and use of the Class. For terms apply to C.F. Hartt, Sept 25-1m High School, St. John, N.B."

N.B. Reporter - Aug. 8, 1862 The Awards at The London Exhibition. - It appears that to New Brunswick have been awarded the following prizes: ...For a general collection of woods and minerals of the colony. J. DeWolfe Spurr, New Brunswick, for products obtained by the distillation of coal."
Carleton County Sentinel - Aug 16, 1862 Dr. Holmes, of the Maine Scientific Survey, found a vein of excellent marble in Aroostook County which he thinks probably extends across the country into New Brunswick."

Carleton Sentinel - Feb 15, 1862 A natural history society has been formed in St.John."

Morning News - Jan. 8, 1862 Mechanics' Institute. - The first of Professor course of Lectures on Geology, and Mineralogy was delivered at the Institute on Monday evening. The Hall was filled except the lower part of it. The Lecture was very interesting to all who take an interest in such subjects, and was made as popular as possible. The second of the series will be given tomorrow (Thursday) evening, and the third on next Monday evening. All who take an interest in Geology should attend the course."

N.B. Courier - Jan. 11, 1862 Professor Bailey delivered the first and second of a course of lectures on ""Geology and Mineralogy"" in the institute on Monday and Thursday evenings. The third lecture will be delivered on Monday evening next."

St. Andrews Standard - Jul. 9, 1862 Dr. Holmes of the Scientific Survey, has been some weeks upon the Sebois and vicinity. We learn that hefinds excellent marble in several townships, commencing the No. 4.9th Range, and thence probably across the country in a northeasterly direction, towards New Brunswick having already traced it through five townships. He goes from then to Woodstock and will return home by way of Houlton.- Aroostook Paper."

New Brunswicker - Jun. 12, 1862 Mr. Pratt has arrived in this city with some valuable specimens of gold bearing quartz from Prince Edward Island and Nova Scotia. We are informed that Mr. Pratt has been sent by the British Government, and corresponds with the London Times; if so, his visit may prove beneficial to the Province, and have the effect of awakening our people to the necessity of ascertaining the value of the auriferous deposits of New Brunswick. We are also informed, that if requested, Mr. Pratt will deliver a lecture at the Institute."

Daily Telegraph - Oct. 17, 1862 Minerals. - The President of the University has sent all the newspapers a copy of a statement drawn up by Professor Bailey respecting the minerals of the province, and the localities in which they are found. We can find room at present for only one or two paragraphs of the Professor's statement:- ""In conclusion, I would say that it is highly desirable that authentic and representative specimens of the valuable ores and minerals of the province would be collected and preserved for future reference. Such a collection of minerals, ores, and fossils, representing their various localities, would be of inestimable value in the preparation of future agricultural and geological reports, or in the conducting of future geological surveys. As a numerous collection has already been made with this object, by my lamented predecessor, in the museum of the university, and as this collection is not only valuable for reference, but also directly for the purposes of instruction in the institution, it is to be hoped that those interested in the collection of such objects, will favor us with authentic and average samples of the different deposits, as they may from time to time be discovered. Such specimens, whether of ores, minerals, or fossils would be most thankfully received and duly acknowledged by the university. I would especially ask those visiting Campobello, Grand Manan, the North Shore of the Province, the coal mines of Albert and Grand Lake, and other interesting localities, to obtain and preserve any specimens they may meet, or forward them to the university. Any reasonable expense incurred in such transportation will be cheerfully repaid. The locality where the specimen is found should always be mentioned. To the farmers generally, throughout the Province, and indeed to all living in the country districts, I would say, that they may render service of great value, to the future interests of the province, by 14 he simple preservation of whatever objects of curiosity may chance to meet their notice, even though they may be unable of themselves to decide upon their value. Such collections cannot fail to be of interest to those who make them, while the assistance they may render to scientific investigators cannot be overestimated. Wherever geological surveys have been conducted, such private collections have invariably been the source of much useful information."

Codes: GEOL / IDX_Names: Geology - General;
St. Andrews Standard - Oct. 22, 1862 Mineral Resources of New Brunswick - On our first page we have published an instructive communication from Prof. Bailey of the New Brunswick University, - To many (and there are by no means unintelligent) the information in the Professor's letter will be quite fresh and of great practical value. The explanations and directions with reference to distinguishing the various minerals and ores are at once plain and easily understood. From the letter it appears that our County - Charlotte - contains good ores of several of the metals - iron, lead, copper, zinc blende - and even gold has been discovered in this County. - We trust the letter will be carefully and extensively read."

S. J. Daily Globe - Sep. 22, 1862 ""Colonial Empire"" reports Natural History Society received minerals...."

Carleton Sentinel - Dec 12, 1863 The collection of the Natural Society of St. John, N.B., includes some 5000 specimens of minerals and fossils, 2000 marine vertebrae and shells, 700 provincial and other insects (collected and presented chiefly by Mr. Hart and Mr. Jolly); 82 specimens of different kinds preserved in spirits; 30 native and foreign birds, stuffed and numbered, and 500 plants, - making in all about 8,400."

Miramichi Gleaner - Apr. 23, 1864 Geological Survey. - ""The blind and unreasonable opposition of certain members of the Assembly to receiving the report of the Mining Committee, who recommended a thorough Geological Survey of the Province by Mr. Hind, induced a majority in a thin house to temporarily refuse to go into Committee on the subject. Subsequently, however, this motion was reconsidered, much to the satisfaction of the more progressive among our legislators. In the hurry and confusion at the close of the Session there was not time to debate this subject but we are pleased to know that the Government, acting in accord with the spirit of the report, have employed Mr. Hind, a Geologist of some celebrity, to make a preliminary survey of the province. The $500 placed in this year's budget for the general purpose of a survey, will be appropriated of defray Mr. Hind's expenses, the fund of information collected by that gentleman during his tour will be at the disposal of Legislature next Session, so that members can decide upon the advisability of making a further and larger appropriation for a thorough and satisfactory examination of the mineral wealth of the country. We trust the Government will see the necessity of immediately compiling and publishing in the American papers, a statement of our mineral resources as far as already known. The mania in the States for investing in mines still continues, and in this way might easily be turned to the advantage of New Brunswick. - Mr. Hind will make his report at the close of the summer."" The above paragraph is copied from the St. John Telegraph. We of course know nothing of the capabilities of Professor Hind - he may or may not be a fit and proper person to undertake such an important work; and were we assured that he was fully qualified, and that the survey would be carried out to the end in good faith; that all parts of the Province would be honestly dealt with, we should be inclined to favour the undertaking; but we have our fears. We cannot forget the shabby and unfair manner in which the northern counties were treated, when the previous Geological Survey was undertaken by Dr. Gesner. The inhabitants of this County petitioned for that Survey, and on the strength of that petition the Dr. was appointed. Did they send him to the Northern Counties? No. All the other counties were explored and surveyed by him - but when it came to the turn of this and the neighboring Counties of Gloucester and Restigouche, the Legislature thought proper to withhold any further funds, and the doctor made us but a flying visit, of a few days. - This is the way we were used in this quarter then, and we have our fears that in the present undertaking we shall obtain similar unfair treatment. Should the Survey be entered upon, the honest way would be to commence at the Northern

Counties, as they were left out in the last survey. If this be not done, we shall have our fears as to the ultimate or final prosecution of Professor Hind's labours."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Globe - Apr. 25, 1864 Geological Survey. - [To The Editor of the Daily Evening Globe] - Sir:- Surely you could not have been in a serious mood when you penned the article in reference to a Geological Survey in the Globe of Saturday. Prof. Bailey may be an accomplished young man and of amiable disposition, but certainly he cannot be as well qualified for a thorough Geological Survey of the Province as Professor Hind, whose practical experience is very extensive. Prof. B. himself will not lay claim to the many recommendations that the former possesses. Prof. Hind's works on British America are well known, and have elicited the praise of such men as Sir Roderick Murchison, while the severest and not impartial of the British reviewers have spoken of them in commendatory tones, not only as high scientific productions, but as readable and most interesting and valuable specimens of English composition. For the last three years this gentleman has had charge of surveying expeditions through the Red River and Saskatchewan territories, in fact the whole of Canada has been explored under his directions and under instructions from the Colonial Office, from which department he has received thanks and approval. Then Canada and the Labrador Peninsula were explored by him; and his reports of these various expeditions are full and satisfactory. No man can say ought against ""our own Professor"", or the young men who have been his companions on is ""fortnightly tour"" up the Tobique and down the Nepisiguit; but can we ever expect to have a satisfactory survey of the Province in this way. It will cost us five hundred dollars now and five hundred dollars again, until a sum will be wanted in the publishing of 8 ""30 page blue books"", one half of which will have been used for the wrapping paper before the other is published, or the explorations made upon which it is based, more than sufficient to make a thorough and complete survey of the Province at once. But then you may say why not employ Professor Bailey to make this uninterrupted survey? If he is competent, by all means let him be employed in preference to any other. But what will become of the vacant chair in ""the College on the hill"" during Mr. B.'s absence? Will it be allowed to go begging, or will the Professor's class form the surveying party, of which he will have charge? The better way is for every man to stick to his legitimate occupation, - Mr. Bailey as Professor of Natural History in the University of New Brunswick, and let Professor Hind, or any other competent Geologist, make the Provincial Survey. I notice that the Courier on Saturday takes the same ground as you have taken in reference to the sum of $500 appropriated by the Legislature to pay Professor Bailey's expenses in his explorations during the vacation of 1864, and thinks that it would be monstrous and ungrateful to expend this sum in any other way. Now this sum was to be used towards a Geological Survey of the Province, and it was generally supposed, and in fact believed that Professor Bailey would make a tour in some quarter during the summer of 1861, but as there is now an opportunity to have a thorough survey, of course Professor Bailey must stay at home, or travel at his own expense, or that of the Governor, who liberally paid it last year, and the $500 will still go to the purpose for which it was intended, a Geological Survey. I would like to say something in reference to an article which appeared in the Freeman some days ago on this subject, but I have already trespassed upon your space. That article, however, was most unfair and biased, and contained statements which the writer knew to be untrue, and must have been penned with malicious intent. Yours Truly,.... [NOTE - Freeman article not found]"

Daily Telegraph - Apr. 26, 1864 The Geological Survey. - We rarely find an item of news in the Courier, but Saturday's issue contained a statement which certainly is news to the country at large. The Courier alleges that the credit of the province is pledged to Professor Bailey that he shall continue his geological explorations this year at the public expense. Last year, it seems, the Lieutenant Governor, of his own motion, sent Professor Bailey on an exploring expedition and defrayed the cost of his mission out of his own pocket. The Professor's report has been published, and as everybody knows has not made the public acquainted with any new facts respecting the Geology of the province. The reason is obvious. The Professor is not a geologist; the time placed at his disposal was limited; and the Professor himself, while evidently well fitted for the position which he holds in the university, is ill adapted to a rough and tumble expedition of this description. We do not doubt that Professor Bailey undertook the task with reluctance, and was thankful when it was finished. Under these circumstances we must protest against similar labors being forced upon the Professor this year. His duties in the university will no doubt require nearly all his time and attention, and whatever of either the Professor may think he has to spare might be given to forwarding the interests of the university outside of its walls. We are of the opinion that the gentleman himself as well as the country will see it to be good policy to confine his labors to educational matters exclusively, leaving the government free to employ Mr. Hind in the department for which he is peculiarly fitted. We are aware that the government contemplate bearing the expenses of a second tour by the Professor, but we trust they will see the propriety of reconsidering their determination. The article on this subject which appeared simultaneously in the Courier and another city paper and were precisely similar in sentiment, are no doubt the offering of that ""hidden hand"" which has had so much to do of late with religious and railway matters."

Daily Telegraph - Apr. 28, 1864 Resources of New Brunswick. - The explorations of geologists shew that New Brunswick contains vast deposits of mineral wealth, and that the copper and gold now being so largely discovered in Lower Canada extend through the country to be traversed by the Intercolonial Railway. That line would also pass through the coal fields of both New Brunswick and Nova Scotia and thus the necessity which now exists of sending the ores of Canada to the United States to be smelted might be overcome, to the advantage of the British Provinces, by bringing the mineral deposits into practical proximity to the coal region. ..."

Carleton Sentinel - Apr. 30, 1864 Professor Hind, a gentleman of considerable reputation, has been engaged to make a geological survey of the Province during the present summer."

Codes: GEOL / IDX_Names: Geology - General;

Daily Evening Globe - Aug. 9, 1864 Prof. Hind's Geological Survey. - The last numbe rof the Carleton Sentenil contains some interesting observations on the explorations of Prof. Hind in that section of the country, and the peculiarities of the formations met with:- Many of our readers are aware that Professor Hind has been specially instructed by the Government to examine, and report upon, a particular series of Rocks, which have been ascertained to exist in this Province, called the ""Quebec Group"". But few, we imagine, know the nature or importance of this formation, or in what particulars it is of interest to the geologist or the public at large. The ""Quebec Group"" is the name given by Sir W.E. Logan to a series of strata which are distinguished by the extent and value of the minerals they contain. It is the great metalliferous rock series of North America, and abounds in ores of iron, copper, antimony, lead, nickel, cobalt, and even silver and gold. Most of the newly discovered mines in Canada belong to this group of rocks. In it are found the celebrated copper deposits of Lake Superior, and the less known copper mines of Canada East. The gold of the Chaudiere Valley is derived from the ""Quebec Group"", and the greater number of the minerals sent by Canada to the International exhibition, at London, which attracted so much notice, were the products of this great metalliferous belt. Its true character was first ascertained in the immediate neighborhood of Quebec in 1860. and in honor of that ancient city, Sir William Logan gave it the name it at present bears. Its thickness in Canada is not less than 7,000 feet, and we understand from Prof. Hind that its thickness in New Brunswick will not fall short of, if it does not exceed, the development it has in Canada. The ""Quebec Group"" extends in a narrow band, or in bands of varying breadth, from Gaspe to near Montreal. It then passes in the form of a very narrow belt into Vermont, New York, Virginia and Georgia. The gold so long since obtained from the auriferous drift of Georgia, and which now probably supplies the Confederates with no inconsiderable portion of their sinews of war, comes from rock belonging to the Quebec Group. - Prof. Hind has already ascertained that the breadth of this important formation is not less than 40 miles in the Counties of Restigouche and Gloucester, and about 47 miles on a line drawn North West from Long's Creek to about 13 miles beyond Woodstock. On the South West Miramichi and Shiktehauk, the breadth of the formation is about 40 miles. With the valuable ores of iron in our own 10 neighborhood, we are all familiar, and the different branches of industry to which they have already contributed, and have, in fact, created. It is with much satisfaction that we are enabled to state upon the authority of Prof. Hind, that these ores not only exist over a tract of country already known to be at least 30 miles in length, but they occur in two or more parallel lines, from 2 to 8 miles apart, and with the ores are associated bands of limestone. Drift clays and sand cover the outcrop of these deposits to a small depth in some parts of their course, but it is probable that over a considerable area of their known development they will be practically available. The country where they occur, particularly between the two Shiktehawks, is well wooded, and in parts very fertile. It will not fail to strike the reader that we have thus, in our own immediate neighborhood all the material requisites for great mining industries to spring up. Ore in abundance, limestone for smelting purposes, and timber for fuel, besides a fertile soil for farming pursuits. - These are the natural gifts which only require the hand of man to make them available and, commercially, most valuable. What we require is capital, and that will soon reach us when the resources of the country become known, and those resources described in a manner which shall inspire confidence of scientific men in Europe, to whom capitalists are now in the habit of appealing for an opinion on subjects connected with mining enterprise remote from their own observation. We understand that Prof. Hind is now about to descend the Tobique and its south eastern tributaries to ascertain the outcrop, or north-western limit, of the Quebec Group in that direction. We are aware that deposits, and very favorable indications of other metals, besides iron, are known to exist in our country within the limits stated above, and we confidently hope that ere long these hidden treasures will be profitably brought to light. A great step has been gained in establishing the existence of so broad a belt of the metalliferous rocks of North America within the limits of the Province, and we trust that every facility will be afforded to Prof. Hind to investigate and describe the mineral wealth of the ""Quebec Group"", which he has already shown to occupy no inconsiderable portion of this and adjoining

Colonial Farmer - Aug. 29, 1864 A fine specimen of petrified wood has been handed to us by Mr. John Connor, who discovered it among stone hauled in from the Hanvill road for macadamizing purposes."

St. Andrews Standard - Dec. 14, 1864 The ""Eastern Advocate"" ... confederation ... In her present political conditions, it is obvious to every unprejudiced mind, New Brunswick never can become a manufacturing country. Her resources of mineral wealth -her coal, iron, copper, shales, manganese, antimony, clays, wood, wool, hemp, flax, - everything she can raise out of, from under, or upon her soil must be exported as raw material... Does not every man in Albert County 9 know it to be literal truth? Look at the Albert Mines - sending away 20,000 tons of Albertine a year, and out of $300,000 its ordinary value, leaving less than $30,000 behind for royalty and labor - over nine-tenths go to enrich foreign capitalists - of course the cost of opening the mine, sinking shafts, or erecting machinery is not included..."

Codes: GEOL / IDX_Names: Geology - General;

S.J. Globe - Feb. 23, 1864 We have as yet had time only to glance at the Report on the Mines and Minerals of the Province prepared by Professor Bailey. We see enough, however, to satisfy us, first that the admirable series of papers, on the Tobique country, which appeared in the Colonial Presbyterian, were, as we suspected, from the pen of the

Professor; and second, that this Report is well written and complete in itself. We wish, however, the Government had undertaken the responsibilty of binding up with the Report a Geological Map of the Province. This Report is the gift to the Province, of His Excellency the Lieutenant Governor, who seems to understand what we want much better than do the members of the Legislature. Time after time, the press, with hearty unanimity, has called upon the Government to have a Geological Survey made of the Province; but the Government has either never had the funds for the work at their disposal, or else they have been fully satisfied of its necessity. His Excellency, however, out of his private means, supplied Professor Bailey with the necessary funds, for a geological tour last summer - and the result is detailed in the pamphlet before us. Of course, a tour of six or eight weeks could not result in a complete scientific survey of New Brunswick, yet Professor Bailey has done wonders, in the time at his disposal. Of his work we shall speak hereafter. The discussion in the Legislature, upon the printing of the Report, had in it much of the style adopted towards His Excellency by the Fredericton City Council. It is true that a majority of the House voted to print the Report, but the vote should have been carried, if not without discussion, with at least an expression of thanks to His Excellency both for the interest he took in the matter and for his generosity. Looking, however, to the composition of the House we must be thankful that the Report was received at all. Prof. Bailey, no doubt, has too much good sense to be annoyed at anything that was said. He has probably read the history of Percival, the poet and Geologist, who was engaged by the New Hampshire Legislature to make a Geological survey of the State. Percival's name will last forever, but who knows now the name of one of the nothings that strutted his brief hour in the Legislative Halls of that State, when the poet was at his work?"

S.J. Daily News - Feb. 24, 1864 We have received the Report on the Mines and Minerals of the Province. It contains information relative to the mineral resources of the Province which cannot fail to be of great value. Prof. B. deserves much credit for the excellent Report, and his Excellency is entitled to the thanks of the people for having not only suggested the exploration, but for providing out of his own pocket the travelling expenses of the explorer."

Miramichi Gleaner - Jul. 9, 1864 Original Communication. - Messrs. Editors:- It may not be as generally known as it ought, that our Provincial Government made provision during last Winter, for what has long been considered a great desideratum, namely, a thorough Geological exploration and survey of the Province. Partial and superficial surveys have been made from time to time since the days of Gesner, but those from their very nature could only end as they did in disappointment, without any beneficial results whatever. Our Executive has now most wisely secured the services of a gentleman (Professor H.Y. Hinds) who brings to the work not only a thorough scientific education, but a great practical experience acquired in our sister Province, Canada, under the supervision of, and associated with, that eminent Geologist, Sir William Logan, whose reputation is now world-wide. Mr. Hinds commenced his labours by ascending the Restigouche from Dalhousie to the Upsalquitch, following the latter River and a portage of eight or nine miles, he entered the big Nepisiguit, and thence descended to Bathurst. He remained in Bathurst two or three days only, merely a sufficient time to ascertain the general character of the Rocks, deferring a more regular and scientific investigation to a later period (it is to be 3 hoped) in the present season. He has now proceeded to Miramichi, and it is highly desirable that his presence there should be widely made known in order that the various points of interest in the vicinity, may be brought at once under his notice, particularly the localities of metallized veins or deposits, so that he may be enabled by visiting them to determine their properties without unnecessary delay. There can be no doubt that there are various substances now lying dormant in our rocks, which, if the light of science were thrown upon them, would prove of great economic value. We know we have metalliferous Rocks in abundance, and why may we not say auriferous? A short time should tell. Canada has achieved much of its importance, through the development of Geological Science. New Brunswick in this respect, at least, may well take her as a model, and strive to get a fair startin the great road to mature wealth and distinction. Mr. Hinds will be found by all who desire to put themselves in communication with him, affable and courteous, like most men of genuine talent free from pedantry or dogmatism and cheerfully disposed to render any information in his power relating to the work he has in charge. R.W.B. Bathurst, July 6, 1864."

Daily Telegraph - Jul. 8, 1864 Professor Bailey, Mr. Matthews, and Mr. Hart, are at work on the Geological survey of the county of St.John. They commence at St. Martins. It is proposed to survey St. John and Albert pretty thoroughly during the present summer. - Presbyterian."

Miramichi Gleaner - Jul. 9, 1864 Professor Hind - Geological Survey. - In another page we have inserted a communication from a Correspondent in Bathurst, respecting the labours of Professor Hind, on the Nepisiguit and Upsalquitch rivers, to which we call the attention of readers. On Wednesday evening last we were pleased to learn from him that his labours on the rivers named above, were highly interesting and gratifying, and that he has been enabledto collect therefrom, a number of valuable specimens of rocks, &c. He proceeded to Fredericton on Thursday morning, and we understood him to say, that after a brief sojourn there, he will return to his labours in the Northern Counties. The suggestion thrown out your Correspondent respecting the handing in of specimens, is a good one, and we shall be happy to receive for the inspection of Mr. H. any such that may be handed to us."

Carleton Sentinel - Jul 16, 1864 A correspondent of the Gleaner speaks favorably of the geological labours of Professor Hind, in the vicinity of the Nepisiguit and Upsalquitch rivers."

Codes: GEOL / IDX_Names: Geology - General;
Miramichi Gleaner - Jul. 16, 1864 Geological Survey. - We last week alluded to the labours of Professor Hind. We have since been informed that he was employed by the Government in April last, to make a preliminary Geological Survey or Examination of the Province, with a view to a more thorough Survey, to commence next year, has made important discoveries, which leave no doubt of the Mineral Wealth of New Brunswick. The Professor has not only satisfied himself, but Sir William Logan, has confirmed his views, that the Economic Minerals found in Canada, will be found in equal abundance in New Brunswick, and that the Canadian group (so called) including the rich mines of the Chaudiere, is continued across New Brunswick, and to the Atlantic coast of Nova Scotia. The belt where explored from the Upsalquitch to the Nepisiguit, is from 30 to 40 miles wide. Among the specimens found by the Professor, is the gold bearing quartz and gold contained from washings. We are glad to hear that the Government have taken upon themselves the responsibility of directing a Survey of that portion of the belt which offers the greatest hopes of wealth, and that the Counties of Gloucester and Northumberland are considered to be especially rich in minerals. We feel, that should the views of Professor Hind be correct, not only will another inducement be afforded for the construction of the Intercolonial Railway, but we may add, the very means of such construction will be furnished by that section of country through which we hope it will pass. We shall anxiously wait further developments."

N.B. Courier - Jul. 16, 1864 Geological Survey. - we learn from the Miramichi Gleaner, that Prof. H.Y. Hinds, the gentleman employed by the Government to make a thorough Geological survey of the Province, commenced his labours by ascending the Restigouche from Dalhousie to the Upsalquitch, whence he proceeded to the Big Nepisiguit, and descended that stream to Bathurst. After ascertaining the general character of the rocks in that neighborhood he proceeded to Miramichi. From a brief interview with Prof. H. the Editor of the Gleaner learnt that his labours on the rivers above named were highly interesting and gratifying, and that he had collected a number of valuable specimens of rocks and minerals, some rich specimens of gold bearing quartz, and several pieces of pure gold washed from the sand. It is not unlikely that a more thorough examination may lead to the discovery of gold in considerable quantities."

Daily Telegraph - Jul. 22, 1864 Mr. Frederick Hart, son of Jarvis Hart, Esq., of St. John, has been appointed by the Government of Nova Scotia to make a Geological Survey of that Province. Mr. Hart was a student of Acadia College in Wolfville, and subsequently graduated at Harvard University, Cambridge."

Carleton Sentinel - Jul 23, 1864 and S.J. Daily Globe - Jun. 25, 1864 Professor Hind passed through Woodstock the first of the week, on his way to the Shicktehauk, there to prosecute his mineralogical surveys. The Professor during a few days spent in this vicinity found much to interest him among the iron, copper, slate, &c., which abound here."

Miramichi Gleaner - Jul. 23, 1864 and Miramichi Gleaner - Aug. 6, 1864 Hind report on glacial drift... FULL TEXT"

S.J. Daily News - May 8, 1864 Dr. A. Gesner, well known throughout the British Provinces and the neighboring Republic for his literary and scientific attainments, died at Halifax on Saturday last."

Carleton Sentinel - May 14, 1864 Dr. Abraham Gesner, well known in the Province, by his publications in connection with our resources, died at Halifax on Saturday last, aged 67 years."

Headquarters - May 18, 1864 Demise of Dr. Gesner. - Dr. A. Gesner, well known throughout the British Provinces and the neighbouring Republic for his literary and scientific attainments, died at his residence in Dresden Row, Spring Gardens, on Saturday last. Dr. Gesner was among the first to investigate the geological features of this province, and the result of these investigations, which he made public some years since in a well written treatise, has, no doubt, had a beneficial effect in aiding the Province to attain that rank which her vast natural resources has since enabled her to occupy. - Halifax

Carleton Sentinel - Nov 19, 1864 Professor Hind is on a visit to Charlotte, and is favorably impressed with the value of the mineral deposits in copper, etc."

Codes: GEOL / IDX_Names: Geology - General;
Headquarters - Apr. 26, 1865 and Daily Morning Telegraph - Apr. 29, 1865 Important Metalliferous Rocks in Maine. - A few weeks since a lecture was delivered in the city of St.John, N.B., by Professor Hind, on some points connected with the Geology of New Brunswick, of which Province Professor Hind has been making a preliminary geological survey during the

past summer. The excitement attending the recent elections in St. John, which were taking place during the week in which the lecture was delivered, evidently engaged the attention of the St. John press to the exclusion of all other matters, for we find no notice of this lecture beyond a few complimentary paragraphs. An attentive correspondent, not locally interested in Provincial politics, or much troubled with predelictions for antis or cons, has supplied us with a synopsis of a portion of the lecture which has reference to the mineral wealth of Maine. After the return of John A. Poor, Esq., Hon. Mr. Johnston, and others of the party who visited New Brunswick and Canada in August last, in connection with the Frontier defence question, and who saw Professor Hind at Woodstock, N.B., we were made aware of the existence in New Brunswick and Maine of a group of rocks called the ""Quebec group,"" (of Sir William Logan), the great metalliferous rock series of North America. Some of the party again met Professor Hind in Montreal during the month of September, and in company with him and some of the officers of the Canada Geological Survey they visited the Geological Museum, and were shown the metals and minerals and specimens of the strata characterizing the ""Quebec Group."" The lecture recently delivered at St. John referred to the distribution of this group in New Brunswick, but its extension into Maine was represented on a colored geological map exhibited by Professor Hind. The lecturer stated that in Canada and in various States of the Union, there have been discovered, from time to time, sedimentary rocks exceedingly rich in metalliferous wealth. The shores and islands of Lake Huron, have long been remarkable for their enormous deposits of copper. The immense aggregations of ores of the same metal in East Tennessee, and in Lower Canada, are contained in rocks of the same geological age, though known by different names. The vast lead deposits of Missouri, associated with zinc, cobalt, nickel, and copper, have long been known to belong to the most ancient sedimentary rocks; and from similar deposits the gold of the Appalachian range, from Virginia to Georgia, has been originally derived, as well as in Nova Scotia. Sir William Logan was the first to show, in 1860, that all these different metal bearing rocks, some of which are more than a thousand miles apart, belonged to one and the same formation; and because this formation was well developed near Quebec, and first studied and understood there, Sir William Logan named it the ""Quebec Group."" Not only is the ""Quebec Group"" the great metalliferous formation of North America, but its remarkable thickness and complexity, (7000 feet, or one mile and a third), coupled with the extraordinary manner in which it was deposited and brought to the surface, all unite to make it one of the most interesting and important formations of the entire geological series, with, perhaps, the single exception of the coal measures. Its iron, copper, nickel, cobalt, antimony, lead, zinc, chromium, arsenic, titanium, silver and gold, which are all known to exist in remunerative quantities in this vast rock series, give it a special value which no other possesses, a value greatly increased by the association with these ores of metals, of serpentines, roofing slates, soapstones, potstones, whetstones, magnesites, dolomites, and building stones. This great formation stretches from Gaspe to Alabama, then sweeps round through Kansas to Lake Superior, where it reappears without any dimension of volume. Its age is that of the Chazy, Calciferous, and part of the Potsdam formations of the New York Survey, and it occupies a position near the base of the Lower Silurian System. It has been brought to the surface in Canada, New Brunswick, Maine, Nova Scotia, and Newfoundland, by a series of undulations, or parallel folds, originating from lateral pressure coming in a southeasterly direction, similar to that which has given rise to the Appalachian chain of mountains. These folds have broken through the upper crust, and exposed the surface of the Quebec Group. One of these great undulations crosses the St. John below Presquile, and taking a southwesterly course enters the State of Maine near the Forks of the Meduxnekeag, pursuing its course towards the Atlantic Ocean on the north flank of the granitic axis, where it is represented on C.H. Hitchcock's Map of Me., as a belt of mica schist. Prof. Hitchcock also describes in his Report, and delineates on his Map, another and more southerly belt of granite, which has also, according to Professor Hind, brought up the Quebec Group to the surface, from the Atlantic coast of Maine nearly to the St. John River, N.B. The occurrence of this great group of rocks in the form of two belts within the limits of the state is most important, for we know that the rich antimony deposits of New Brunswick, the vast beds of iron ore at Woodstock, some fourteen miles from Houlton, the copper and the manganese, which occur in the same neighborhood, are all situated in the Quebec Group, and there is no reason to doubt that they extend into Maine, and may be found, together with all the other minerals enumerated above, in these broad belts, extending from the Atlantic at Mount Desert to the New Brunswick frontier. In fact, the vast area described by Hitchcock as Mica Schist in Me., is stated by Hind to be the ""Quebec Group."" In the spring of 1864 Professor Hind visited the River du Loup, and drew up a report on the probable auriferous wealth of an area then about to be purchased by a company of well known Boston gentlemen. In that report he stated that he had discovered gold in quartz veins of Upper Silurian age on the land about to be purchased by the company. The Canadian Commissioner, (Major Belleieuille), states in November last, after mentioning Professor Hind's discovery, that gold has since been found in every quartz vein on the du Loup which has been properly examined, and that these veins extend to the frontier. Here then, we have conclusive evidence that gold bearing quartz exists on our northern frontier, and no doubt far within the limits of the State. In Canada the gold on the du Loup is found on the old Kennebec road, and this ancient route passes through the auriferous tract on the frontier and this State for an unknown distance southwards. When Professor Hind's report on the New York is published, we shall probably learn more about the existence of the ""Quebec Group"" in Maine and its metalliferous wealth, both in the Province and our own State. - Maine State Press."

Codes: GEOL / IDX_Names: Geology - General;

Headquarters - Apr. 26, 1865 Geological Survey. - We publish from the Maine Press an article reviewing a lecture delivered by Professor Hind, in St. John, sometime in the beginning of this year, during the election excitement. Under different circumstances the lecture would, no doubt, have received the attention it merited. As the subject interests our Yankee neighbours as nearly as ourselves, it is not surprising that it should have attracted their attention. Professor Hind has made during the course of last year extensive explorations throughout the Province, and will lay the result of his labours before the House, in the shape of a preliminary report, giving a general view, in a systematic shape, of the geological features of the Province. It will be then for the House to determine whether they shall have, by a practical man, and a man of some note, and who can devote his whole time to the work, a thorough and practical survey. It is not a work that can be performed in a season, but will take several, and money will be well and judiciously expended in helping to execute such a work. We believe such a survey would be of the greatest possible benefit to the Province. It would give a correct view - and in the shape for reference - of the extent and value of its mineral resources, in which it is undoubtedly rich, and enable the Government to set a right value on the Crown lands of the Province, which are now disposed of utterly regardless of the unknown riches which may be buried under them. We are sure the subject will receive the unbiased attention its great importance demands."

Headquarters - Aug. 16, 1865 We find the following notice of Professor Hind's preliminary Report in the London Evening Register:- Professor H. Youle Hind, who, not very long ago,was among us narrating his experiences in the Labrador Peninsula, has now completed a geological survey of New Brunswick. His ""Preliminary Report"" thereon, which we have just received, though not in the nature of things so interesting to the general reader as his ""Explorations in Labrador,"" will be warmly welcomed by geologists. His chapter ""On the Surface Geology of the Province"" is so valuable, and it contains such a decided outcome on one of the questions now under discussion in the world of science, that we think it right to give the ipsissima verba of the report. Professor Hind is too tried an observer to have the facts on which his conclusions are founded called into question, and his statements are all the more valuable, as they refer to a region which has not before

S.J. Morning Journal - Dec. 8, 1865 Mr. Robert Matthew read a very valuable paper on Minerals, as a source of national wealth, at the Natural History Society, one Friday evening. We hope to notice it more fully in a future issue. The Society have under consideration the propriety of memorialising the Legislature to continue the grants in aid of the Geological exploration of New Brunswick."

Codes: GEOL / IDX_Names: Geology - General;
Headquarters - May. 10, 1865 The Late James Robb. ""Not unremembered in the hour when friends met. Friends, but few on earth and therefore dear.""Sir. - The memory of the late Dr. James Robb is treasured by very many who have been permitted to survive him, and any reflections on his scientific reputation cannot fail to pain those who knew him well and had implicit faith in the soundness of his views. It is with much regret that I am compelled, from a sense of justice to the memory of an old familiar friend, to call attention to, and to correct, some statements made by Professor Bailey in his recently published ""Observations on the Geology of Southern New Brunswick."" On page 6 of his ""Observations,"" Professor Bailey says, when speaking of the Geological Map constructed by the late lamented Dr. Robb, ""This Map has heretofore been the only one extant, and has been regarded by those out of the Province as the best authority upon the Geology of this country. Its principal faults are:- 1st. The various formations indicated by special colours, are with few exceptions, made to represent mineralogical characters only, and not distinct geological groups. One colour represents red sandstone of whatever age."" This statement, I beg leave to say, is not true. Dr. Robb, on page 6 of Johnston's Report, states - ""I have retained the red colour at present over a certain 5 imited extent, rather to indicate the mineral nature than the geological age of the rocks where it occurs."" This is the only case where Dr. Robb specified mineral characters ""over a limited extent"", by a colour; for in his letter he speaks of the true age of the greater part of the red rocks. All the other colours on his Map indicate geological groups of rocks, as he himself states in the letter printed in Johnston's Report. ""I have endeavored,"" Says Dr. Robb, ""to exhibit on it at your request, the views which up to this time I have acquired from various sources concerning the area occupied by the different groups of Rocks in the country."" It remains for Professor Bailey to explain his misconception of Dr. Robb's published statements. ""2d. Not sufficient distinction has been made between the different varieties of eruptive rocks,"" &c. &c. ""The presence of stratified beds among these eruptive rocks seems to have been entirely overlooked."" (Observations, &c., page 6). Again I am compelled to say with regret, that this is not true. Dr. Robb states, and Professor Bailey himself quotes his words, ""Great part of St. John, Charlotte, King's and Queen's counties is spoken of by Dr. Gesner as a trap district. I regard it rather as a slate country, cut through in many places by dykes of igneous rock,"" &c. I submit, with respect, that slate is a stratified rock, and that Dr. Robb expressly calls attention to the presence of the very kind of rock Professor Bailey says he ""entirely overlooked."" In the same paragraph Professor Bailey says ""Two colours are employed, one indicating granite, gneiss, &c., the other trap, syenite, felspar rock, &c. This has given rise to the occurrences over all portions of the map of isolated patches of igneous rocks, leaving it impossible to connect them in any consistent series, and equally impossible to determine which of the several varieties of rock is meant to be indicated."" Once again, I regret to state, this is not true. Curious enough, Professor Hind in his recent Report points out the very characteristics the late Dr. Robb aimed at showing. In describing origin of Granite he says, page 50, - ""Near the Magaguadavic, for instance, it was found impossible to find the line of demarcation between the granite and granitoid gneiss, so imperceptibly were they blended one with the other."" Hence we may reasonably infer, not that Dr. Robb was wrong, but that Professor Bailey found it ""impossible"" to comprehend Dr. Robb's grouping of rocks, which subsequent investigation by a third party, acting independently of either, shows to be correct. The apology which Professor Bailey made for Dr. Robb's ""imperfections"" is not needed as those imperfections, it has been shown, originate in the crude on ception of Professor Bailey himself. I do not think it necessary to combat the Professor's ""third fault"", namely, that Dr. Robb's map is ""too small"", for I stand in the presence of Professor Bailey's recent geological production,

with its fifteen bright colours and its baker's dozen of ""new names for old things"". I can understand the tremulous hope he expresses ""that its representations will be found accurate."" I confess, I tremble for his fate. Though possessing but a smattering of science, my experience tells me, that the novelties of young geologists like Professor Bailey and his associates, are often doomed to melt into thin air before the tried realities of such men as Sir W.E. Logan and Professor Hind, whose discoveries and statements Professor Bailey ignores with the same cool assurance he displays in distorting and misrepresenting the cherished words of one who is no longer with us to answer for himself. C. Fredericton, May 8th,

Codes: GEOL / IDX_Names: Geology - General;

Headquarters - May. 10, 1865 Geological Survey of New Brunswick. - We have before us the ""Reports"" of Professor Hind and the""Observations"" of Professor Bailey, Messrs. G.E. Matthew and C.F. Hartt. We confess, however, that the simultaneous appearance of these ""Reports"" and ""Observations"" before the House of Assembly, both printed and embellished, if the word pleases, with maps and plans, puzzles us amazingly. In Professor Hind's Report we have his appointment to make a special survey of a certain district given in the usual authorised style, and a similar official appointment to make a preliminary survey of the entire Province is announced in a letter to Sir W.E. Logan. But in the ""Observations"" of Messrs. Bailey, Matthew, and Hartt, not the slightest mention is made of any appointment to do the work they have undertaken; neither is there any authority for the publication of their Report, or for the lithographing in New York of their huge map of many colours, and gigantic sheet of sections, and yet there is printed on the outside of Professor Bailey's Report, ""Printed by order of the House of Assembly,"" and yet the whole thing was ready for distribution before the House met. We have no doubt the House will look to this. But, as journalists, we must direct attention to the unheard of practice of having two reports emanating from two different parties on the same subject, and positively going over the same ground, one with authority, the other without authority, and yet both appearing to the outside world, unless the matter is rectified, as sanctioned by our House of Assembly. Has our House of Assembly suddenly become scientifically mad, that they will tolerate this? Are we to cry out economy, economy, and yet send to New York for lithographed Geological maps, on a scale of three inches to a mile, and sections of unheard of dimensions. What if all these expensive maps should prove mere trash! Who are the parties that have ""got them up!"" Professor Bailey is a very young Professor, certainly, we should say, he has not seen the shady side of eight and twenty. Mr. Matthew is a clerk in the Custom house at St. John, and may be six and twenty. Mr. Hartt is a student in the Museum of Comparative Zoology in Massachusetts. These gentlemen make wondrous comparisons between the Rocks about St. John and those in Canada. Were any of the trio ever in Canada examining the rocks in question? They invent new names with a facility and stoical indifference to the previous discoveries of others, that must be positively charming to a Yankee mind. They have fenced the city of St. John with an array of Geological terms which will serve savans there for ages to come. They have called the Grand Laurentian System of that kind old Geologist, Sir William Logan, ""The Portland Group. ""They have altered his sounding ""Devonian Series"" to their ""Coldbrook Group"". They have called his latest triumph, for which the wise men of Europe have recently showered honours on his head, the ""St. John Group"". They have changed Sir Roderick Murchison's ""Silurian"" into ""Kingston"". The Chemung Group of Hall they have rebaptised ""The Mispeck Group"",

and Logan's immense series of Gaspe Sandstones they have transmuted into ""Bloomsbury Group"". The magnificent development of the ""Quebec Group"", which Professor Hind has shown to occupy an area of 4,000 square miles in the Province, and which was fully illustrated at the Provincial Exhibition, and in a letter laid before our Government, special attention called to it by Sir William Logan, the youthful author of the ""Observations"" before us ignores altogether, gives it a new name, calls it the ""Mica Schist formation"", is doubtful about its geological age, and to give it a local habitation he examines his geological scale, ""looks for vacant places,"" finds one, and pops his ""Mica Schist formation"" into it without a moment's delay. (page 44). The style in which they do the thing is superb. Mr. Matthew ""throws together the following remarks."" Professor Bailey ""makes hasty examinations of fossils"", and showers down notes of interrogation as if his ""hasty examinations"" must be resumed at leisure, but meanwhile the world must not lose the hint he darkly intimates. The student, Mr. Hartt, is marvellously accurate. He describes the fossils in 444 feet 11 inches of rock. ""300 feet of which is estimated."" This 444 feet of rock (with the eleven inches) is the ""Little River Group."" The ""Little River Group"" lies just between ""the Mispeck"" and ""the Bloomsbury Group"", and ""the Little River Group"" itself contains, A ""The Dadoxylon Sandstone,"" and B ""The Cordaite Shales."" Old fashioned Geologists, men with heads on their shoulders, would call the whole batch ""The Chemung and ortage Group"" of Professor Hall of Albany, and thus accord the rightful honor to the man who first discovered it, and an acknowledgement, in common with the rest of the world, of his merit in describing its position in the scale of rocks; but sucking geologists, in their attempts to purloin a false reputation, follow the shadow in mistake for the substance. We are surprised and grieved that Mr. Matthew, who has long been favorably known, should have permitted his map to be thus prostituted. His map was excellent as a local map to illustrate a paper before the Natural History Society of St. John, but as a Provincial map, sanctioned by our Legislature, it becomes ridiculous and absurd. We have given a sample of the nomenclature of the ""Observations"", which will suffice for the present. Now for a specimen of their reasoning, which if it does not wake up some of the dreamy old geologists who are hovering about Silurian, Devonian, Laurentian, and such old fashioned ""groups"", we shall give them up as ""gone suckers."" Professor Bailey is discoursing on the ""Portland Group"". (By the way, we have a faint recollection of a ""Portland Group"" in England. A glance at Lyell shows us to be correct. Is there not a chance that the ""Portland Group"" of Messrs. Bailey, Matthew, and Hartt, is likely to clash with the ""Portland Group"" of Sir Charles Lyell! They represent rocks of very different ages. On second thought we do not think there is a chance of clashing). As we said before, Professor Bailey is discoursing on the ""Portland

Group"". He says - ""As the latter are unquestionably of Upper Devonian, the beds of Portland were supposed to represent either a portion of the lower division of the same formation, or possibly the upper part of the Silurian. Dr. Dawson alone, while still adopting the latter view, called attention to the great resemblance between these rocks and those of the Great Laurentian Series in Canada. It is with much gratification that we are now enabled to confirm, with a good degree of certainty, this opinion of their antiquity and geological position."" (Page 18). The italics are our own. Now, we ask any reader whether the above passage commits Dr. Dawson to the ""opinion"" that these ""Portland Group"" rocks are of Laurentian age. We say, that without any doubt, Dr. Dawson's opinion refers to the rocks being of Upper Silurian age, and he notices only their ""resemblance to Laurentian rocks,"" and yet this is the style of argument which runs through the whole of the Report. We notice too the frequent use of the words ""unquestionably"", ""undoubtedly,"" ""it is rendered certain,"" ""impossible,"" as if the dicta of our youthful geologists were to be regarded as final, instead of its running a very probable risk of its being preserved and demolished in six months' time. The way, too, in which these young gentlemen quote one another, correspond with one another, and print one another's opinions, is positively astounding, and must be a caution to geologists generally. The best of the joke is, that they actually, one and all, promise us ""some more."" Professor Bailey is to give us something ""in greater detail"". We hope he will find it near Fredericton, so that we may immortalize the names of some of our citizens. ""The Needham Group"", for instance, would sound well. And in memory of departed visions and visionaries, why should we not have ""The Confederation Group!"". Would there be much difficulty in determining the characteristic fossils of this formation? With this incipient ""group"" we shall leave the authors of ""Observations"" for the present. Professor Hind's Report is voluminous. It occupies 293 pages, and all the questions bearing on the geology of the Provinces are temperately and cautiously discussed. Professor Hind makes no assertion which he does not substantiate by facts. He gives to other workers in the same field their need of praise. We notice, too, that he invariably gives both sides of an argument, and states his reasons for adopting one view or the other. He speaks very respectfully, and even with admiration, of the late Dr. Robb, the brother of our lamented friend having afforded him the opportunity to peruse some of the doctor's geological notes. The result of his observations on the geology of New Brunswick are most encouraging. There can be little doubt that the Province will occupy a prominent position in the world for its mineral wealth. We are glad to find that the idea is fast gaining ground among the members of the Assembly that we must immediately have a systematic geological survey. The co-operation of Sir William Logan and his associates is most valuable and

Morning Journal - Feb. 5, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (1st installment) : - ISSUE MISSING."

Morning Journal - Feb. 9, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (continued) : There were many such disturbances at this period. Faults, folds, and displacements everywhere abound, the rocks have been baked and hardened, as if by heat, while all volatile products were driven off, ordinary bituminous coal being thus converted into the hard anthracite, or even into graphite. At the same time the metals, such as ores of gold, copper, lead, &c., together with gems such as beryl and others, brought up by the igneous outbursts, or drawn from the sides of fissures by chemical vapours, became deposited in the cracks and crevices, forming mineral veins. Finally, both rocks and veins became hard and solid, the arches became firm and immovable, and mountain chains were left where only shallow basins or low level islands existed before. Of course, with these vast and wide-spread changes, animal and vegetable life was, at the same time greatly affected, and in many districts probably, largely if not wholly exterminated. But you may naturally inquire of me what has become of these mountain chains and what was the force which could thus call them into being? Let me answer the latter question first. It was a force which came from the ocean, a force due to the pressure exerted by the great oceanic basins against the firmer continental borders. It has been acting through all time and is not yet dormant, being the necessary result of that process of shrinkage which is due to the cooling of a once heated sphere. It was this force which in earlier times raised the Laurentian Hills of Canada, the nucleus as it were of the continent, it was this force again which at a later period caused the elevation of the Allegheny range, stretching from Canada to Georgia, it was this, too, which raised the principal mountain chains of other countries. Moreover all these great mountain systems are on the borders of their respective continents, and that mountain system is always the highest which faces the largest ocean. The old Laurentian hills are low, for the oceans of the period, though broad, were shallow; the Allegheny mountains again bear nearly the same relation to the present Atlantic, as the high Rocky Range does to the broad and deep Pacific, or the snowy peaks of the Himalaya to the vast expanse of the Indian Sea. Through all the geological history of America this fact stands prominently forward, that the border of the continent was the seat of constant oscillation and disturbance, ever 9 rising and falling, either in gentle movement, or else resulting in the formation of mountain chains. Our own Province, lying on this border, has been within the theatre of disturbance, and here as elsewhere there have been elevations and depressions, some of them, as we have seen, of great magnitude. But you have asked me what has become of these mountain masses, which I have said once occupied the lower portion of our Province. In answer I must again refer to the sea, the great destroyer as well as the great architect of the world. No sooner had those mountain ranges been formed, which may not have reached above the ocean level, (for the sea has its mountains and valleys as well as the land,) than the winds and the waves and currents began again the work of destruction, beating powerfully on exposed coasts, or wearing down the tops of submarine ridges and carrying off the materials to be again deposited, and to form the stratified beds of another era. This new era, upon which we are now to enter, is the Carboniferous or great Coal producing period of our history. It was not, however, until somewhat later that any true beds of coal were formed. All great geological ages extend from one epoch of disturbance to another, and the name Carboniferous is assigned to that vast interval of time which elapsed between the disturbances closing the Devonian age and others which followed at a later period. No true coal was here formed in the Lower Carboniferous epoch. The land, as we have seen, was then rough and broken, sharp ridges everywhere protruded, both above and below the level of the sea, and the latter, by its waves and currents, was everywhere wearing away the reducing these ridges to a common level. Rivers may also have aided in this denuding process, (for the elevation of the land, if to say considerable height, must have caused a condensation of moisture in the form of rain,) but the principal action seems to have been marine. Powerful currents washed away large masses exposed to their fury, and often carried them long distances from their parent beds, while on the other hand the waves would as constantly heap them up again, worn and rounded on the beach. The great valley of the Kennebecasis seems to ave been one special channel for these currents, and the Bay of Fundy was undoubtedly another, for the former is wholly, and the latter partially, filled with the material thus washed down from the bordering hills. In the Bay of Fundy only isolated patches of these pebble beds are now found, (for the currents of that Bay are still in action wearing away and building up again even as they did in that early age,) but in the Kennebecasis valley they may everywhere be seen. They form the bold bluff of the Minister's Face, nearly opposite Rothesay, the railroad in many places is excavated through them, they constitute the high hills of Pisgah and Picadilly near Sussex, and the wild and picturesque ridges of Upham. Even the top of Shepody Mountain is capped by them, and they again stand sharply out in the bold promontories of McKay's, Roger's

Morning Journal - Feb. 14, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (continued) :
In New Brunswick the conditions requisite for the formation of coal do not seem to have been so constant asin the sister Province. Over the entire coal basin the rocks are coarse conglomerates and sandstones, filled with drift-plants, and tell us only of gradually emerging sand-reefs, or beds of gravel, subject to constant alteration, and occasionally giving birth to a few straggling plants, or detaining and burying those floating by in the changing currents. Some portions of the basin were indeed above the water, and swamps, in which grew luxuriant forests, prevailed in the more central regions, as at Grand Lake and elsewhere; but those prolonged conditions, so remarkable in the coal measures of Nova Scotia, of estuaries and lagoons, extensive forests and low jungles, giving rise to accumulations of enormous masses of vegetable matter, now represented by the coal beds. Do not seem to have been present in New Brunswick, where such deposits never exceed a few inches in thickness. It is true that much of the district covered by rocks of this formation is still uncleared, but the observations of all the most competent authorities tend to discredit the belief in any considerable coal beds in the Province. It would seem that the oscillations has there been too rapid, that not sufficient time was allowed for that slow accumulation and decomposition of vegetable matter, which could alone result in the formation of coal. And how vast an amount of time did that process require! If there were but 100 feet of coal in all, it would correspond to between 500 to 1000 feet of vegetable debris. But we must also remember that the coal beds themselves are but a fractional part of the deposits formed at this era. They make up in fact not more than 1-50th of the entire formation. For it was not an age of continued verdure; there were still repeated oscillations of level, long intervals of rank vegetable growth, succeeded by others when the sea, or perhaps fresh water lakes, breaking their low barriers, swept sand and mud over the broad and low swamps; submerging whole forests at a time, and storing away the products for a future age. The waters would then retire again, new vegetation would spring up as luxuriant as before, only to be again buried under new accumulations of sand and clay. In Nova Scotia these changes continued until 14,570 feet of deposits were formed, and in that depth, as shown by Logan and Dawson, there are 76 coal seams and dirt beds, ""indicating,"" says Dana, ""as many levels of verdant fields between others when the waters prevailed."" If we suppose these changes to have been even twice as rapid as similar ones at the present day, still what a vast amount of time must have elapsed while those seventy successive forests bloomed and passed away! But Time is an element for which the geologist must make an unlimited demand. If the same causes produced in early times the same results, and with just the same rapidity as now, (and we have no reason to believe otherwise), then the mind soon becomes lost in the contemplation of such vast periods. The Carboniferous age, lengthy as it was, was but one of many ages as long or longer than itself. The great Azoic age, when no life yet stirred, and the larger portion of the world was still a watery waste, - the Silurian, when islands were rising here and there, and only the seas were peopled with few and lowly forms of shells and corals, and then the Devonian when the land too, though small, sustained a forest vegetation, and Fishes had been added to the life of the waters; all these must have occupied immeasurable periods of time. And still we have advanced barely half way on our geological journey. Many long ages succeeded the Carboniferous before the introduction of Man, ages marked by great changes in the physical and organic features of the continents. But here, so far as our Province is concerned, our record fails us. With the exception of the Triassic or New Red Sandstone era when the wild cliffs of Blomidon rose as volcanoes in our neighboring province, and curious animals, formerly thought to be birds, left their huge tracks on the soft sandstones of the Connecticut River valley, we find nothing to tell us of the condition of New Brunswick until a much later period. Even the New Red Sandstone beds are rare, as at Quaco and Gardner's Creek, and are destitute of organic remains. They tell us little beyond the fact that the Bay of Fundy then occupied a somewhat higher level than now, and was, as now, marked by strong and variable currents. The land, although we know nothing of it as far as our own Province is concerned, was probably well covered with vegetation, which while in some respects, it resembled that of the Carboniferous forests, had also many modern features. There were Pines and Palm-like trees in the branches of which dwelt insects and probably birds, while beneath roamed Reptiles of gigantic size. Remains of the latter have been found in Prince Edward Island, and probably existed here as well. Some few quadrupeds, allied to our modern Opposum had also been introduced. You will perhaps wonder why, if all these forms of life were so abundant, we should have so few traces left of their existence. But you must remember that fossils can only

be formed when the conditions are favorable, that the bodies of animals and plants can only become hardened and preserved to us by being imbedded, soon after death, in layers of soft sand or clay, which hardening around them, are gradually converted into a perpetual tomb. This can only happen under the influence of moving waters, and if the continent be above the sea, its borders only can record the lives of its inhabitants. And this was actually the case during the long period which followed the close of the Carboniferous age, the land in this portion of America being then above the ocean, and probably even higher than now, its former border being now submerged, - but in other portions of the country deposits were still forming, and these enable us to complete the history. During this long period, which can only be measured by hundreds of thousands of years, the American, as well as the other continents, underwent most important changes both in their geography and their living tribes. There was first the Jurassic Age, very similar to that of the New Red Sandstone, but when reptilian life attained its greatest development; then the Cretaceous, when the immense beds of Chalk were forming in the ancient oceans, also were Fishes allied to those of our day, as the Salmon, smelt and herring, and when too the vegetation of the land took upon itself new features, adding the oak, the beech, the poplar, and the palm to the pines which had long ago existed before; and then the Tertiary age, when the continent had nearly its present extent and level, and when over its plains roamed Horses, dogs, hyenas, panthers, as well as camels, elephants, and the rhinoceros all far larger than any now living, and many of which are no longer to be found upon this side of the Atlantic. In this interval too, rose the Rocky Mountains 16 and the Andes, the Alps, the Appenines, and the Himalayas, all the loftiest mountain systems of

Morning Journal - Feb. 18, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (last installment) : - ISSUE MISSING."

St. Andrews Standard - Feb. 24, 1866 Rock Record of New Brunswick. - The ""Morning Journal"" is publishing Professor Bailey's interesting and instructive lecture, and delivered in the Mechanic's Institute, on the ""Rock Records of New Brunswick"". It abounds with information which must be interesting to every native of the Province, and it is written in a pleasing style, avoiding as much as possible, technical terms. We trust that some of our enterprising publishers, will issue it in book form, and that it may prove as remunerative to them, as it will be useful to the people of the Province."

S. J. Daily News - Jan. 10, 1866 Professor Bailey's Lecture. - The lecture of Professor Bailey in the Institute, on Monday night, was attended by a numerous, a respectable and intelligent audience. From the beginning to the end he commanded the undivided attention of his hearers, and displayed a thorough knowledge of his subject. He spoke highly of the natural, although as yet undeveloped, resources, of this and the neighboring Provinces, and dwelt at considerable length on the natural turmoils and upheavings of which this part of the continent must have been the scene in the past, as indicated and read in the tattered mineral volume which surrounds our immediate vicinity. He spoke of the comparatively recent period when the lower districts of this portion of our Province were submerged, and accounted theoretically for the appearance of the rocky and mountainous aspect visible all around. Of the mineral resources of our Province, the lecturer has a very high opinion, and he believes that a thorough and careful examination would prove that in richness the mineral deposits equal the expectations of the most sanguine votaries of the science of geology. There was evidenced throughout the lecture a very intimate acquaintance with the features of many parts of the Province, and a knowledge of their peculiarities which could only have been attained by a careful personal observation and diligent study. The lecture was, even merely as a piece of composition, remarkably good. The arrangement of the subject was excellent, and the manner of its delivery clear and distinct, though if it had been read in a louder key and more emphatic style, the audience would have relished the subject better."

Morning Freeman - Oct. 6, 1866 Professor Dawson is about to issue a second addition to his Acadian Geology, and in a letter to Professor Bailey, of our University, he asks for information and specimens likely to render his work more complete. Professor Bailey, in a letter to the Journal, says:- ""The subscriber will gladly receive and thankfully acknowledge any information which will tend to add completeness to the above most important work. Any facts upon the geology, and especially the economic products of the Province will be very acceptable. As the value of such work depends to a great degree upon its accuracy, it is hoped that only such information will be given as is thoroughly reliable."" The Journal, determined to make the most of this opportunity for misrepresentation, says:- ""The Circular of Principal Dawson, which we copy today, reminds us of the folly of the late Government in arresting the Geological survey of this Province, which was proceeding steadily and with the greatest economy, by means of the painstaking efforts of Professor Bailey and his associates, Mr. Matthews and Mr. Hart, a work which Professor Hind also made considerable contribution. Dr. Dawson is obliged to begin his circular with the words ""the public surveys of the Maritime Provinces not having made sufficient progress to render the work unnecessary,"" etc. Had Professor Bailey been permitted to go on with the work which he had begun, the Geology and Economics of the Province would now be much better known than they are, and the information thus obtained, like that already collected by Professor Bailey, would soon be diffused throughout the whole scientific world."" What will our readers think of the statements of the Journal when we inform them that the late Government did nothing whatever to arrest the Geological Survey in which Professor Bailey and his associates were engaged. 19They did prevent the accomplishment of Mr Mitchell's job for quartering Mr. Hinds on the province; but they made precisely the same provision for Mr. Bailey's survey that had been made by their predecessors. We are sorry to be compelled thus frequently to expose the misrepresentations of the Journal."

Colonial Farmer - Oct. 15, 1866 Professor Dawson is about to issue a second addition to his Acadian Geology. He desires the assistance of all those in the Maritime Province who can furnish him information where with to make the publication as useful as it ought to be. Prof. Honeyman of Nova Scotia and Prof. Bailey of New Brunswick have agreed to assist. - Others will, it is hoped, lend their aid."

Miramichi Gleaner - Apr. 18, 1868 The Miner's Dream. --The day was done; he swallowed a crust--The last he had in his locker. He placed his head on the bag of dust, And his hands on the pick and trocker. .. And there by the Yuba's lonely stream, His tent the murky sky. He dreamed the most auriferous dream; Alas! that't was all in his eye. .. He saw the noble palace of gold, Which the ancient Spaniards sought -The dome of gold was lofty and bold, And the pillars with gold inwrought. .. On a glittering throne the Inca sat- (Of solid gold 'twas builded)-""His mutton was served on a golden plate, And his gingerbread was gilded."" .. And the guards wore golden plumes so tall-And their helmets shone like suns-They fired at a mark with golden ball, Which were cast for their golden guns. .. The golden rod waved in every breeze, And the gold-thread grew in the brakes-Goldfinches twittered in all the trees, And gold-fish in the lakes. .. ""I give the all!"" the Inca cried, ""My palace, my guard, my throne-And the river's bed and the mountain's side, Their treasures are thine alone."" .. Now over his dream a change hath come; The fields are rocky and bare, He dreams of his old New England home, And the memories clustered there. .. He walks by the run at Seymour's pond, Where he hauled the pickerel in; Ah! the grapes of which he was so fond, In the former age of tin. .. Hurrah! Point Rocks! the ocean shore, And the marching tides deploy, With the same wild rush and the same wild roar, That thrilled him when a boy. .. Now the school-house red, with its hopper roof, And its dust and noise and fun, And the ferule's whisk, and the sharp reproof, And the shout when school was done. .. Anon he dreams of the Sabbath day, The Sabbath bell doth toll, And serious faces throng the way, And serious thoughts the soul. .. And when in dreams he had ceased to roam, And walked by the Yuba river, He thought of his wife, and his child, and his home, And of God, the perfect giver. .. Why change the treasures of the heart, For glittering lumps like ??? ? So across the Isthmus he took a start, And came home by way of Chagrea."

Royal Gazette - Aug. 26, 1868 (492) Crown Land Office, Aug. 24, 1868 Mining Leases on Crown Lands in the County of Charlotte, will be offered for sale by Public Auction at this Office, on Wednesday the 23rd day of September next, agreeably to the following Regulations. . Upset price, $20 per Lot. -- 1st. - Every mining Lease to be exempted from payment of Royalty for five years from its date. 2nd. That the right of Mining within a Tract of one Square Mile, for the term of twenty five years, be put up at a fixed rent of one shilling per Chaldron on Coal, and five per cent on the value of all other Minerals raised, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Governor. 3rd. That the upset price for each Lot to be twenty dollars. 4th. - That the preference money be paid, and the ground selected within one hour after the time of sale, after which other Lots will be offered if required, in like manner. 5th. That the lease contains a clause or renewal, or that the Government may resume and take the improvements at a valuation to be made by Arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his assigns. 6th. - That if the Lessee shall not actually raise Coal or other Mineral to the value of four hundred dollars per mile from this ground within any one hear after four years from date of said Lease, and so on annually during the continuance of the Lease, the same shall become forfeited. Richard Sutton, Sur. Gen."

Morning Journal - Dec. 23, 1868 and N.B. Reporter - Dec. 25, 1868 Prof. Bailey's elaborate and instructive lecture on ""Volcanoes"", at the Institute on Monday attracted afine audience, who must have acquired a great deal of valuable information. It was illustrated by diagrams kindly furnished by the Lieutenant-Governor."

Headquarters - Jul. 1, 1868 Scientific Patriotism. - A fine work on Acadian Geology has lately been given to the public by Professor Dawson, of McGill College, Montreal, (formerly of Nova Scotia) and in his introduction the learned author very naively shows how much, in his mind, science predominates over patriotism, and how willing he is to be consoled for the loss of independence of his country by the extension of the Geological survey over it. Professor Dawson's avowal of sympathy with the indignation of his countrymen is, by the way, a valuable testimony to the reality of the widespread feeling against union in Nova Scotia, often doubted, coming indirectly, and with no motive whatever for conveying a false impression. He says:- ""Though as a Nova Scotian, I must sympathize with the natural indignation of my countrymen in view of the hasty, and I fear, ill-advised Imperial legislation which has deprived them for the present, at least, of their cherished independence and direct communication with the Mother Country, and has attached them to the new and untried Canadian Dominion, I shall rejoice if the Confederation shall result in the effectual extension of the labors of the Canadian Geological Survey under the able management of my friend Sir William Logan, to the whole of British America. The Nova Scotians demand bread and they are offered a stone, and the Professor is inclined to think it no bad substitute. It is questionable if the Nova Scotians, denied the independence of their country, will feel gratified and recompensed by a complete classification of its rocks."

Daily Telegraph - Jul. 14, 1868 C. Frederic Hartt, Esq., A.M., Professor of Natural History and Geology in Vasser College, Poughkeepsie on the Hudson, has kindly sent us the Third Annual Catalogue of this popular Institution ..."

St. Croix Courier - Sep. 3, 1868 Prof. Bailey of the University of New Brunswick is now in St. Andrews, prosecuting his geological explorations."

S.J. Daily News - Apr. 15, 1869 Natural History Society ... Several fine specimens of fossils, taken from a stone quarry in the neighborhood of Hartt's Mill (Fredericton Junction), on the Oromocto River, were handed in as donations from Dr. Sheehan, of Blissville, and W.R.M. Burtis, Esq."

Daily Telegraph - Apr. 17, 1869 A Fossil. - We were shown, yesterday, a fine fossil, found near Northwest side Grand Lake, N.B. It was turned up by a person digging potatoes, who supposed hehad found a petrified deer's horn. It will be presented to the Natural History Society by J.R. Marshall, Esq., Chief of Police."

St. Croix Courier - Aug. 19, 1869 Prof. Bailey and Dr. Sterry Hunt have been in this vicinity for several days, engaged in geological investigations."

Codes: GEOL / IDX_Names: Geology - General;

Daily Telegraph - Feb. 2, 1869 Seventh Annual Report of the Council of the Natural History Society of New Brunswick. - ... The minerals are now almost entirely arranged, and the Curators are about preparing a catalogue which will materially assist students in this branch of science. In regard to the Geological department of the museum, the Council have much pleasure in stating, that especially since the return of the Hartt collection, the leading geological features, or rather the principal fossils, of the Province are exceedingly well represented. They would further state that a new case has been ordered for the last named collection, which, having been carefully arranged by Dr. Dawson, will prove a very valuable addition to this part of the cabinet; and that they trust by the sale and exchange of the duplicates of these fossils to add largely to other groups of curiosities in the possession of the Society. The Council have also to comment with much pleasure upon the generosity of different gentlemen by whose donations the list of scientific specimens and objects of curiosity has been greatly enlarged. The names of these benefactors during the past year and their respective donations are comprised in the following list: Character and Name of Donation Name of Donor Impression of rain drops in slate from Hazen st., near Calvin church Mr. J.L. McInnis ... Fossils from limestone rocks near Ottawa Mr. C.E.L. Jarvis ... Samples of coals from different localities Mr. R.P. Starr ... Portion of root of petrified tree from Dutch Valley, King's County Mr. Enoch Dole ... Fish remains of Cretaceous period from Bahia, Brazil Prof. C.H. Hartt A number of Chemung fossils, Itheca, New York "" Ores from Smoky Valley, Nevada "" Medina Sandstone, western New York "" Undetermined mineral from Chester County """

S.J. Daily News - Jul. 7, 1869 Dr. T. S. Hunt, of Montreal, and Prof. Bailey, of the University of New Brunswick are in town. They are about making a tour through the Province on a Geological Survey."

Daily Telegraph - Jul. 7, 1869 Dr. T. Sterry Hunt, R.S. - This distinguished Chemist and Mineralogist is now in our province. After stopping a day or two in St. John, he has proceeded to Charlotte County, in company with Professor Bailey, toassist in settling some knotty point in Geology, the identification, we believe, of some metamorphic rocks. He is on the staff of the Canadian Geological Survey. His papers read before the Royal Society, have caused a sensation in England. In the United States he ought to be in constant remembrance. Finding that they and others were in need of a suitable and inimitable tint for their bank-notes, he took the trouble of inventing the green tint which has given its name to the famous green-back issue. The tint is patented in the United States, Canada and throughout Europe. Possibly, however, some of our readers may not have previously heard that Dr. T. Sterry Hunt was its inventor. We are pleased to find men like Dr. Hunt aiding in making a thorough Geological survey of our province, and augur, from it, the best results."

Daily Telegraph - Jul. 8, 1869 The Geological Survey now being conducted in this Province, under the superintendence of Sir Wm. Logan, is being prosecuted by Dr. Hunt and Professor Bailey as already mentioned in our columns. Mr. Charles Robb, C.E., is at work in York County and Mr. Weston, Lapidary, on the Kennebecasis. His work here is the collection of fossils, and he will join Dr. Hunt and Mr. Bailey in Charlotte."

Codes: GEOL / IDX_Names: Geology - General;
Morning Daily Telegraph - Jul. 14, 1869 A Summer Ramble. - The Nepisiguit. - … After examining the rocks that form the bed and banks of theriver, we sat down upon a fragment of granite with our backs against a cliff of Bonaventure rock, and thoughtfully pondered over the following description from the pen of a Geologist:- ""Rough Waters is a classic spot, the river deriving its name from these rapids which in the Spring and Fall are very magnificent. Here the red sandstones of the Bonaventure Formation, are seen lying in nearly horizontal layers upon the granite, which reveals itself as the floor of one of the earliest seas belonging to the Carboniferous age. It is surely worth while to pause here for a few minutes and endeavour to realize what is the true significance of the expression, ""the floor of one of the earliest seas belonging to the Carboniferous age!"" It means that we are gazing upon rock which formed the bottom of an Ocean whose waves rolled over where we are now supposed to be standing before any portion of the vast coal fields of New Brunswick, Nova Scotia and Cape Breton was begun to be elaborated by the wearing down of already existing rock; before a single plant had been called into existence, of the countless myriads which lie entombed in the coal deposits of this fourteen thousand feet thick mass of rock, which is called the Eastern Carboniferous area or coal field of America, as distinguished from the Western area, which occurs in Pennsylvania, Ohio, Missouri and other Western States"". GEOLOGIC PERIODS. - This was enough to set the most phlegmatic imagination at work, and to call up long trains of dreamy thought that wandered backwards and still back into the depths of the forgotten past. This small section of granite laid bare by the current is a fragment of the vast anticlinal axis that stretches away South West across the Province, appearing on the Miramichi, crossing the St. John below Woodstock, forming the Falls of the Pokiok and continuing its onward course till it loses itself among the islands of Penobscot Bay in the State of Maine, fully 300 miles away, and against it recline the Carboniferous strata that cover the whole Eastern portion of the Province. At the dawn of the Carboniferous age, an unknown Ocean lashed it with billows that broke in long lines of foam upon an iron bound coast. Strange forms of animal life moved upon the beach, or swam in the waters, and Ferns of extinct genera but beautiful outline waved in the breeze a few yards away. How vast the ages that have rolled away since. Suppose that some giant hand seized hold of the edge of Carboniferous strata exposed in the bank and rolled it up like a vast scroll, leaving the Devonian rocks bare underneath. The border would reach down to Oromocto Lake, South of the St. John, and the scroll roll away Eastward, carrying with it the larger portion of the Counties of Gloucester, Northumberland and York, nearly the whole of Sunbury and Queen's, a large fragment from the Northern of King's, the whole of Kent and Westmorland, and a considerable portion of Albert. It would roll up the bottom of the Gulf and embrace Prince Edward Island in its mighty folds on its onward course. Its southern end would strip off the greater portion of Cumberland and Pictou in Nova Scotia, wrap up the Magdalen Islands and the coal regions of Cape Breton and Newfoundland and come to the surface on the rocky heights of Inverness and Cape Ray, leaving behind a sea 14,700 feet, or 2 1/2 miles in depth. To realise the immense period required for the deposition of the strata we have stripped off, we must quote Prof. Hind again. Some conception of the vast lapse of time involved in these ideas may be formed, when it is considered that in Nova Scotia there are no less than seventy-six seams of coal, each with its dirt bed, or bed in which a large portion of the plants forming the coal grew, succeeding one another; each coal seam and dirt bed indicating a

period of repose and the growth of interminable forests, in which insects, such as termites, cockroaches and scorpions wandered, dragon flies, weevils and locusts flew, and where numerous reptiles, all now extinct, luxuriated in the vast swamps and estuaries of the Carboniferous period. Each coal seam was succeeded by long ages during which the waters covered the land, until in that vast lapse of time a thickness of no less than 14,750 feet of deposits was accumulated in Nova Scotia alone."" ... (History)... fades away into insignificance and the whole period becomes almost inappreciable in extent, when placed side by side with the mighty epochs of the Geologist. The whole period during which man has presided as monarch of the world, is but the first step in the long, long journey of the Geologist into the far off realms of the past. And here inscribed upon these rocks, in Geological characters, are the records of a period so remote that whole eons of time have rolled by, and whole creations have been brought into existence and served their purpose and passed away, and others have taken their place ere the dawn of human history began. As the sun has already reached its meridian height, and the Pabineau Falls are yet to visit, we must cease indulging in dreamy speculations, and hasten to bring our observations to a close. The reddish colored rock forming the perpendicular bank against which we lean, and whose undersurface fits into all the indentations and hollows of the granite, showing that it must have been deposited at the bottom of a sea that rolled over these rocky domes after they had assumed their present form, belongs to the great Carboniferous system. It is the Bonaventure rock of the Geologist, and in this region, at least, constitutes the lowest member of the Sub-Carboniferous Division. It crops out here as ""the rim of the basin"", containing the great Coal field of North-eastern America, and its horizontal position shows that it has never been subject to the volcanic storms and tempests which have heaved up and contorted the rocks beneath it. (To be concluded)"

Codes: GEOL / IDX_Names: Geology - General;
Morning Daily Telegraph - Jul. 15, 1869 A Summer Ramble (Concluded). - Geologic Formations and Soils. - As the different geologic formations furnish different chemical elements to the soils into which their rocks have been ground down, we naturally expect to find their peculiar characters expressed in the vegetation that covers them. - The Limestone rocks near St. John and Restigouche are thickly covered with the well known white Cedar. The Hemlock (Ables Canadensis) flourishes in the dry gravelly soil that overlies the greater portion of the carboniferous sandstone of Kent, Northumberland, and Gloucester, while the Spruce abounds in its moister and more sandy tracts. The debris of granitic rocks form a congenial soil for some of our rarer plants, and it was with feelings of deep enjoyment that we noticed the little Harebell of Scotland (Campanula rotundiflora) so famed in song... The Pabineau Falls; Singular pre-historic phenomena. - ... the broad platform of granite overlooking the Pabineau Falls. A single glance at the peculiar formation of the bed and banks of the stream brought the remark of Prof. Bailey forcibly to mind:- ""The spot is one of the most singular I have seen in the Province."" ... A Giant's Causeway. - The walls of rock enclosing the river look like the architectural workmanship of a race of giants. The granite has been split into huge rectangular blocks, whose sides are as regular and smooth as if cut by the chisel of the mason, and where they are exposed to the action of the running water they present a beautiful polished surface... The walls, however, do not run with a smooth unbroken face for a greater distance than the length of a few stones, but are broken into at short distances by the absence of some of the blocks constituting the line of the bulwark against which the waters dash. The river rushes with great violence into the recesses from which the blocks are absent, and as the channel is narrow the enraged current dashes impetuously from side to side. The floor or bed of the river resembles the rough outline of a gigantic stair, the steps being the height of single blocks. A succession of leaps from step to step and the sudden turns of the channel lash the waters into foam, and polish the edges of the rocks into strange and fantastic shapes. Numbers of small pebbles are whirled round in the eddies, and by their constant attrition scoop out circular pits and indentations in the rock. A short distance both above and below the Falls, the granitic masses bounding the river no longer present the same regular rectangular forms as at the Falls, but are rude and angular in outline, and sharp of edge. Just below the Falls the river spreads out and becomes calm, flowing gently away round sandbanks and under dense overhanging thickets of Alder. ... Age of the Granite - Thoughts of the Past. - The patches of crystalline rock laid bare here and at the Rough Waters are richly charged with the records of their age, which the eye of the Geologist can alone decipher correctly. The evidence that the granite is older than the carboniferous series of formations has been already mentioned in the description of Rough Waters. The Bonaventure rocks forming the base of the carboniferous system, not only retain their horizontal position nearly unchanged, but fill up the hollows and indentations of the granite with stratified deposits. Again, the granite is found penetrating through Devonian strata in Gaspe, thus proving itself younger than the Devonian, and fixing its age to the period when this ancient formation was drawing to a close, and ushering in the succeeding carboniferous period. It seems to be the unanimous opinion of Geologists that the Devonian age closed, in Eastern America at least, amid volcanic tempests and earth-quake shocks; and they refer us to the numerous parallel ranges of hills, and of granite ridges that give our more important river valleys and sea coasts their northeast and southwest courses. From the lower Saint Lawrence to the Atlantic coast of Nova Scotia and Maine, the whole country has been thrown up into long waves by the subterranean agencies, and these granite ridges which we have looked at with such deep interest to-day, are the summit of one of those waves where the boiling mass below burst through the crust, and spread over the surface, or crystallized the overlying rocks and changed them into granite. It is a mysterious flight, upon which the imagination ventures when it wings its way back to those far off ages, when these rocks were boiling masses of liquid fire, flinging up dense columns of vapor into the skies, and covering the land with a swaddling band of cloud and mist, impenetrable to the rays of solar light. The volcanoes of Restigouche had not yet extinguished their fires, but were pouring forth their floods of lava over the adjacent country, and shaking it with frequent earthquake fits. Nova Scotia and Maine had their volcanoes too, in short the whole of Eastern America, from the Alleghanies to the Atlantic, felt the mighty

throes of the Plutonic agencies toiling far below, and occasionally finding vent in long fissures, running parallel to the Ocean. To use Professor Dawson's words, the whole region was subjected to the intense action of the earth's pent-up igneous agencies; and ""it would seem as if the solid crust had given way, slowly and gradually, to the superincumbent weight, along certain lines; while in others the edges of the beds were tilted up, and the whole surface of Acadia was thrown into a series of abrupt folds, - great masses of plastic granitic matter invading every opening in the spattered masses. This period surpasses every other in the geological history of the eastern slope of the American continent, in its evidences of fracture of the earth's crust. To this period we must refer the greater part of the intrusive granites of Eastern America, and so it also is referable the greater part of the metamorphism of the Silurian rocks, and the origin of the numerous metallic veins by which those traversed."" ..... F."

St. Andrews Standard - Jul. 28, 1869 Prof. Bailey is in Town: he is engaged on a geological survey of this County."

Codes: GEOL / IDX_Names: Geology - General;
Morning Freeman - Oct. 26, 1869 In a summary report of the progress of Geological investigations made in 1868, Sir W.E. Logan, says:- ""As much interest has recently ben excited by the reported discoveries of gold bearing rocks in New Brunswick. Mr. Robb visited some of the lands in Victoria County which had been leased for gold mining purposes. He also visited and made special examination of those localities, within the general area designated, which have been supposed to be productive of other minerals of economic value, or in which mining operations have been instituted. Quartz veins, forming apparently lenticular masses and running in the strike, characterises the slate in many parts, and several in Victoria county werepointed out to Mr. Robb, as having yielded the precious metal. None of it was visible to the naked eye, and specimens of the quartz were therefore brought to the Survey Office for assay. They have been analysed by Dr. T. Sterry Hunt, but no gold has been found in them. This, however, is not to be taken as an absolute proof of the absence of the precious metal in every part of these veins, for the presence of gold in quartz is so capricious that of several specimens taken from the same vein, some may yield a fair quantity and others none at all. The slates in which most of the auriferous quartz occurs in the Eastern Townships of Quebec, are classed as Upper Silurian, and they appear to have some resemblance to those of Victoria, asserted by several respectable persons is a farther evidence on the subject, though none of it rewarded the trials of Mr. Robb.""""

St. Croix Courier - Aug. 4, 1870 Prof. Bailey and Dr. T. Sterry Hunt are now engaged in their Geological explorations of Charlotte Co. ....."

S.J. Daily News - Aug. 6, 1870 Geological explorations.- The 'St. Croix Courier' states that Prof. Bailey and Prof. Sterry Hunt are now engaged in their geological explorations of Charlotte County."

Daily Telegraph - Jun. 29, 1870 Geological Survey. - We learn that Dr. T. Sterry Hunt has been spending some time in the vicinity of Windsor, and at the iron mines at Londonderry, in Nova Scotia. It is his intention to give the greater part of the season for fieldwork, this season, to the examination of Charlotte county. - in company with Professor Bailey. The latter gentleman is now at work, exploring in the region between Hampstead and the Douglas Valley, in continuation of the examination made there in previous years."

Morning Freeman - Mar. 12, 1870 ADVERTISEMENT: Miner's Picks, Steel, &c., C.G. Berryman."

S.J. Daily News - May 13, 1870 Ottawa estimates for N.B. 1870-71:.. Geological Survey & Observatory $4,800"

Colonial Farmer. - Oct. 10, 1870 Exhibition. - Minerals. L.W. Bailey, of the University, showed a large case filled with specimens of New Brunswick minerals, representing as nearly as might be, all the geological periods and the different mineral kingdoms. There were several other entries in this department, but none of course so numerous. In connection with the minerals we may mention that James Neill of this city exhibited a very handsome set of curling stones."

S.J. Daily News - Jun. 8, 1871 Geological - Sir Wm. Logan, the distinguished geologist who passed through this city last week, has gone to Newfoundland to prosecute some researches on that Island."

Colonial Farmer. - Jun. 26, 1871 Geological Report. - Continued. NOTE: Issue missing ...."

Colonial Farmer - May 1, 1871 We are indebted to his Excellency the Lieutenant Governor for copy of a work intituled ""Report of Progressfrom 1866 to 1869."" It is in fact a Geological Survey of Canada, accompanied by Geological and Topographical Maps. Next week we shall give some extracts from this valuable work."

Codes: GEOL / IDX_Names: Geology - General;
Colonial Farmer. - May. 8, 1871 Geological Report. - We propose for a few weeks to occupy a small space with extracts from a Report on a geological examination of New Brunswick by Charles Robb, made by direction of the Dominion Government. The subjectis one of much interest, and will undoubtedly commend itself to our readers. The exploration extended over the greater part of the Counties of York and Carleton, and the south-eastern part of Victoria, embracing an area of 5,500 square miles. After a number of preliminary remarks the writer says:- For the convenience of classification I shall, in anticipation of the results to be hereafter detailed, divide the record of my observations into six distinct sections, corresponding with the geographical and geological lines upon the small map. I. The section of country lying towards the southeast part of the county of York, and overland by the nearly horizontal unaltered rocks of the Carboniferous series. II. The belt or band of metamorphic rocks immediately underlying the former, up to the southeastern boundary of the great granitic area. III. The so-called central granitic area. IV. The band of non-calcareous metamorphic slate and quartzite lying immediately to the north-west of the granitic area. V. The northwestern part of the County of Carleton, occupied for the most part by altered calcareous clay slate; and VI. The Tobique Valley and its tributaries, in the Counties of Victoria and Northumberland. N.B. - Throughout this Report the bearings are stated with reference to the astronomical meridian; the 2 variation of the compass at the time of my visit was 19 eg. 20 m. W. I. Carboniferous Area. This formation, (in which for the present I include the lower red sandstones and conglomerate usually regarded as Lower Carboniferous), in so far as hitherto examined by me, is comprised between the southern boundary of the County of York, and the unconformable altered slates to the northwest. This, however, constitutes only a portion of the northern rim of the great Carboniferous area. The line of outcrop, or junction of the two distinct series of rocks, which is rudely parallel to the strike or general direction of the older rocks is delineated upon the map from my own observations and measurements at a great many points. The Carboniferous (or more properly, perhaps, Lower Carboniferous) rocks, in the northern part of New Brunswick, consists of a series of sedimentary deposits, evidently composed of the debris of the more ancient metamorphic rocks; and rest unconformable and almost horizontally upon the upturned edges of the latter, filling up pre-existing hollows and bays, and but slightly altered in mineral composition, except where invaded, at intervales towards the base, by rocks of igneous origin. Owing apparently to these irregularities in the surface of deposition, and to the prevalence of other disturbing influences, it is difficult to give any exact definition of the component parts of this Lower Carboniferous series, their respective volumes, or even of the order of their succession. The lowest member, resting immediately upon the metamorphic slates, and apparently dipping at and near the line of contact, in conformity with the previously denuded surface, is a coarse dark red conglomerate, composed of rounded and flat pebbles, generally, though not always, water-worn, and consisting of slate, quartz, trappean, and other conglomerate rocks of all sizes up to eight inches diameter. Such of the pebbles as are of a softer or more permeable nature are stained red and sometimes green, doubtless from the penetration of ferruginous matter. The whole mass is cemented by a calcareous and arenaceous paste, sometimes, especially towards the base, with crystalline calcite. Wherever this red calcareous conglomerate rests immediately on the metamorphic slates, the latter seem to partake of the same characteristics, becoming more or less tinged with red and green colors, and impregnated with calcareous matter, which appears both throughout the substances of the slates, and in veins and strings of calcareous spar, frequently associated with quartz, intersecting them. The calcareous impregnation diminishes in intensity as we recede vertically or horizontally, as the case may be, from the junction of the two formations. Succeeding the red conglomerate, which generally 3 becomes finer towards the summit, are red sandstones, also calcareous, but more sparingly so, with occasionally interposed thin and irregular layers of red shale, sometimes so free from grit as to make a good pigment. Both sandstones and shales are sometimes highly micaceous, and the calcareous matter seems gradually to diminish in quantity from the base upwards. No fossils have been observed in these red conglomerates, sandstones and shales, the aggregate thickness of which, from observation made at several points, I have reason to believe is about 1000 feet. Then follows, but only at irregular intervals, a coarse, siliceous conglomerate, composed entirely of rounded white quartz pebbles with a cement consisting of fine grains of sand and feldspar, and totally devoid of lime; above which, in very considerable volume, repose coarse grey grits or sandstones and conglomerates, also devoid of lime, abounding with carbonized casts of calamites, cordaites and other obscure vegetable remains, and holding occasionally thin seams of coal. These last mentioned rocks constitute, in that part of the region examined, the most prominent feature in the main Carboniferous area. Occasionally they are fine grained, and fit for grindstones; some flaggy, in tolerable regular and thin layers but generally very coarse grained and massive, extremely irregular in the size of the component particles, and partaking, even in the same beds, of the mixed character of sandstones and conglomerates. The paste is feldspathic, and sometimes shows the result of decomposition in the presence of small portions of kaolin among the particles. (To be Continued)"

Codes: GEOL / IDX_Names: Geology - General;
Colonial Farmer. - May. 22, 1871 Geological Report. - Continued. The eruptive rocks which, to a limited extent, appear here, are situated at the southwestern extremity of a lenticular shaped area about nine miles in length by a little over one mile broad in the middle, occupied by rocks of a similar nature, attaining their highest development at Bald Mountain and other bold bluffs at and near the foot of Cranberry (or Bear) Lake. This mass is flanked to the south by a considerable breadth of the red calcareous conglomerate and marl formerly described, forming the fertile tract of Harvey Settlement; and on the north by an extensive flat but elevated table land, underlaid by the metamorphic slates; the water shed between the Streams flowing into the St. John river and Passamaquoddy bay respectively. The eruptive mass appears to consist of a central and underlying part or nucleus of very hard and heavy dark red or purple compact quartziferous porphyry,

holding a little calcareous spar,fluor-spar and traces of copper ore in cracks and 6 crevices, overlaid and enveloped first by hard close-grained and homogenous yellowish brown claystone, resembling overburst potteryware, and then by a rock apparently identical in composition and equally close grained but finely laminated in purple and pink streaks, as if deposited from solution in water; the former being the more quartzose, and the latter the more feldspathic portion. The laminae run in the general direction of the length of the mass, and dip in opposite directions on either side of it, generally at an angle of 45 degrees, but with many and violent contortions. The conglomerate and marl of the lower member of the carboniferous series appear to a very limited extent to the north of these rocks, but are chiefly developed in the opposite direction. A good section of all these rocks is afforded by the railway cutting at the foot of Cranberry Lake; but as it intersects them longitudinally, or at a very oblique angle it does not throw much light upon the structure, in so far as measurement is concerned. The following may be taken as an approximate estimate of the thickness of the various members of what are considered as belonging to the trappean mass, that of the sedimentary strata being here obscure:- 1. Central mass of quartzose porphyry, (breadth) 1800 feet. 2. Claystone, compact and close grained, (thickness) 1250 feet. 3. Laminated and contorted quartzose and feldspathic rock, (thickness), 600 feet. Within the limits of the trappean area described are four hills composed of these rocks; the highest of these, called Bald Mountain, is about 380 feet above the plain, with a steep mural face to the west, near the base of which at one point I observed the claystone trap overlying a coarse conglomerate, either of an eruptive or highly altered character. The other elevations are about 220 feet in height, all very near each other, clustered around the foot of Cranberry Lake, and about the centre of the eruptive area. A little coal is reported to have been found in the grey sandstone overlying the red conglomerate in Harvey Settlement, and hopes have been entertained in the locality that this might lead to workable deposits; but in so far as regards the character and condition of the rocks here, there is little to justify such an expectation, since they are situated quite near to the base of the Lower Carboniferous, and appear to be devoid of the characteristic underclays which accompany workable coal seams. About half way between the St. Andrews and Fredericton road, and the sharp bend of the St. John River at the mouth of Long's Creek, the junction of the metamorphic and carboniferous rocks is well exposed near the house of Nicholas Barber; where the former are seen dipping NW <80 degrees, and the latter, now free from the influence of intrusive rocks, about SE <20 degrees, both being highly calcareous towards the junction. The pebbles of the red conglomerate here, especially towards the base, are for the most part angular, composed of slaty and trappean rocks, and of all sizes up to six inches. The breadth of the conglomerate band and its associated red rocks is here over half a mile, and the thickness, assuming the dip to be uniform, about 1000 feet. About five miles to the eastward of this point, where a section of the rocks is afforded at Kelley's Creek, the red rocks do not exceed one hundred paces in breadth; beyond which they no longer appear to come to the surface, nor have they been observed by me in the whole distance thence to the main river, upwards of nine miles. The siliceous conglomerate and coarse grey sandstone are observed in this interval in immediate contact, dipping in opposite directions at high angles, and both devoid of calcareous matter. The Fredericton and Saint Andrews road runs for this entire distance parallel to and a little southeast from the line of junction of these formations, occupying an elevated though irregular ridge of the grey grits, at an average height of 400 feet above the main river, the tributary streams running in opposite directions on either side of this ridge. On approaching the river St. John the country underlaid by the metamorphic rocks become more rugged and mountainous; and at and near Springhill, five miles from Fredericton on the Woodstock road, cliffs of these rocks rise to the height of from 300 to 500 feet, generally with steep mural faces to the north and east. The junction of the metamorphic and carboniferous rocks on the right bank of the river, although concealed by the superficial deposits, I have good reason to believe to be about four and a half miles above Fredericton, near to which point the attitude of the carboniferous rocks, where exposed, is ambiguous and perplexing; in one instance I observed the grey grits dipping apparently at an angle of 65 degrees to the SE. In tracing the line of junction to the northeast we find evidence that on reaching the main river it coincides with its course, and runs under its bed for a distance of four and a half miles; that is, from the point above noted, to a little below the ferry at Kingsclear, where it again comes out on the right bank; and enclosing a circular area of about two and a half square miles, crosses the river at Indian Village to Keswick Bluffs, and thence skirts the right bank of the Keswick River for about five miles from its mouth. The line I have described forms, as will be seen by the map, a deep sinus or bay in the older rocks, which is occupied by elevated ridges of highly contorted and altered slate and quartzite. Near Springhill, at the mouth of Sutherland's Creek, and at a few other points along this line where exposures occur, these rocks are observed to become red and calcareous, probably from proximity to the red conglomerate and marl, which, however, do not actually appear in place on this side of the river until reaching the area at Kingsclear, formerly regarded as an outlier of the formation. Here the strata lying at the extreme base of the carboniferous series, are well exposed; consisting chiefly of alternating thin beds of red conglomerate and marl, the latter occasionally holding nodules of limestone; and the conglomerate, when in contact with the slate, being composed chiefly of angular fragments of that rock, which, in ascending, are gradually replaced by rounded and transported pebbles. On the opposite side of the river, which is here expanded to an average breadth of about one and a half miles, and studded with large alluvial islands, the red conglomerates and sandstones are displayed in considerable force from Clarke's Mountain, opposite Springhill, to Keswick Ridge on the right side of the river of that name. Clarke's Mountain is a dome shaped trappean mass or knob rising in a bold and picturesque manner from the brink of the river to the height of 280 feet. The rock is a mass of very hard and heavy close-grained blackish green basalt or dolerite, with perpendicular joints running east and west, about eighteen inches apart, and another set dipping SE <25 degrees. At the river bank it is seen reposing on nearly horizontal coarse red sandstone and conglomerate to the height of thirty-five or forty feet and traceable about two miles up the river, where it attains a height of 350 feet; giving a total thickness of about 1000 feet to the red rocks at this point, where the eruptive rock which caps them, with a steep face to the river for the whole distance from

Clarke's Mountain, appears to terminate in a wedge-shaped point, giving place to the grey sandstone and conglomerate. The mineral character of the eruptive rock, in its continuation westward from Clarke's Mountain, is somewhat different from that found at the latter place, as above described, being of a lighter color and inferior density, with less regularity in the arrangement of joints; vesicular and amygdaloidal, the amygdales being composed of calcspar, green earth, and occasional zeolitic minerals. From the termination of the wedge-shaped eruptive mass northward, the grey grits and conglomerates form the continuation of these high lands; rising to an elevation of from 400 to 500 feet, and skirting the left side of the Valley of the Keswick in an amphitheatre of bold bluffs, for several miles upwards from the main river. Three miles due east from this intrusive mass another of similar dimensions and mineral character occurs. This emminence, which flanks the Royal Road, on the south side of the Nashwaaksis Valley, and is called McLeod's Mountain, attains a height of 340 feet, and is capped by the eruptive rock to a thickness, at the only point where I could obtain an observation, of 170 feet, with a perpendicular face to the west. The rock is vesicular and uncrystalline, resembling not so much the basalt of Clarke's Mountain as its supposed continuation to the northwest. Here, too, as at the latter locality, it rests immediately upon soft red and green bedded marls with a dip to the SE <2 degrees, overlying red conglomerate and S.J. Daily News - Aug. 10, 1872 GEOLOGICAL SURVEY OF CANADA. - We have received from Dawson Bros., Montreal, a large work in pamphlet form embracing the ""Report of Progress for 1870-71."" It is divided into eight parts. The first contains an Introductory Report by Mr. Selwyn; Extracts from Mr. Hartley's correspondence; Mr. Barlow's work at Spring Hill, Nova Scotia; Mr. Lorne's work on the Ottawa: Work of Dr. Hunt and of Mr. Billings; Additions to the Museum of the Geological Survey. The second part is taken up with the Report of Messrs. Bailey and Matthew on SouthernNew Brunswick, in which first appears a sketch of previous geological investigations, and this is followed with particulars in reference to the Laurentian System and its distribution, the Huronian Series and its three divisions, the St. John or Acadian Group and its location, the Mascarene Series, the Upper Silurian Series, the Devonian Series, Faults and Dislocations, Intrusive Granites, Various Pre-Carboniferous Rocks, Perry Sandstone Group, Lower Carboniferous Series, Carboniferous Series, New Red Sandstone, Economic Minerals, and a List of Mineral Species found in New Brunswick. The third part contains a Supplementary Report by Mr. Robb on northwestern New Brunswick. The fourth part is a ""Report of Mr. Selwyn on the Gold Fields of Quebec and Nova Scotia."" The fifth part is taken up with a ""Report of Mr. Richardson on the country north of Lake St. John."" The sixth part is filled with a Report of Mr. Vermor on Frontenac, Leeds and Lanark Counties, Ontario. The seventh part is devoted to ""Notes of Mr. Broome on Phosphate of Lime and Mica; and the eighth part contains a ""Report by Mr. Bell on the Region North of Lake 10 Superior"". The work is one of much interest, and doubtless will be eagerly sought after."

Daily Tribune - May 23, 1872 Complimentary to New Brunswick Geologists. - Principal Dawson, in an address before the Natural History Society of Montreal, the other evening, remarked: ""Leaving that subject they might turn for a little to the growth of their knowledge of the older fauna of the earth. In America, Paleozoic life descended almost, if not quite, as low as that of Europe. The researches of Mr. Murray in Newfoundland, together with the study of the fossils by Mr. Billings, has revealed a lower Potsdam sandstone, while Messrs. Hartt and Matthew, by their praise worthy explorations of the primordial fauna of St. Johns, had enabled them to establish the Acadian Group, on the horizon of the lower slate group of Jukes in Newfoundland, and of the gold bearing rocks of Nova Scotia. He had reason to believe that Mr. Billings would shortly be able to lead them to still greater depths. and to introduce them to the fossils of Sir William Logan's Huronian

Daily Tribune - Nov. 28, 1872 Promotion. - Mr Geo. F. Matthews, second clerk in the Long Room at the Custom House, has been appointed to fill the position of Botanist and Geologist on the staff of the Canadian boundary survey, with the prospect of an appointment in the Geological Department at Ottawa. Mr. Matthews will receive a much larger salary in his new position. His loss will be much felt in the Customs Department as he was gentlemanly, obliging, steady and thoroughly competent. We congratulate him on his new appointment."
Field and Forest Rambles - by A. Leith Adams, 1873, p.214 The haunts of the Salmo Gloveri… silvery Salmon Trout …… It was noted as far back as 1842 by the late Dr. Gesner, in his ""Geological Report on New Brunswick,"" under the name of ""shiner,"" from specimens seen by him ...."

Field and Forest Rambles - by A. Leith Adams, 1873, p.33 …… a very remarkable object figured in Dawson's ""Acadian Geology"", and said to have been found on the banks of the Kennebeckasis, one of the influents of the St. John river. This work of art, according to the above authority, ""is three feet in length, and is composed of a hard conglomerate, occurring in situ in the vicinity of the place it was discovered. It has the aspect of a rude attempt at the execution of a sphinx or cherub, and may have been a monumental stone, or the ornament of a gate, or the charm of a medicine man."" Acadian

Colonial Farmer - Mar. 21, 1873 S. Napier, Esq., M.P.P., will not deliver his lecture in this city until further notice. He is busily engaged investigating certain proposed acts of Assembly, and has little time at present to devote to ""Natural

N.B. Reporter - Apr. 8, 1874 From the Geological Report of Prof. Bailey and Mr. G.F. Matthew, referred to in our last, we make the following extracts, which will be read with very general interest:- ""So far as we are able to judge at present the following estimate may be taken as approximately correct: Barren grey beds ... 200 feet Productive measures ... 200 feet Upper Coal formation ... 200 feet Making for the whole series exclusive of the Lower Carboniferous formation, a total thickness of only six hundred feet. ""While, however, our observations of the past year are certainly opposed to any opinion which would assign a great thickness to the coal formation within the region examined by us, or even to a belief in theoccurrence of workable seams beneath that which has been so long known and removed near the surface in the Grand Lake district, it should not be forgotten that the area over which the surface seam may be presumed to extend is itself a large one, and that, even supposing the thickness of the seam to be nowhere greater than is shown in the openings already made, its possible yield of coal, more particularly when the facility with which it may be obtained is considered, is such as to confer upon it very considerable value. The following estimates based upon our explorations of the region may serve to render this more apparent. ""The total area occupied by the rocks of the Middle and Upper Carboniferous formation in that portion of the Province which lies to the westward of the eastern boundaries of Queen's and Sunbury counties, (embracing the whole of Sunbury and portions of Queen's and York counties), and of which we have personally examined the larger portion, may be approximately estimated at 2854.6 square miles. Of this about one third, or 952 square miles is apparently covered by the coarse grey beds which from the inferior position of the middle Carboniferous formation, and which, so far as known, are destitute of any workable coals; thus leaving a residue of about 1,900 square miles over which productive seams may be reasonably looked for. We are not yet possessed of sufficient data to justify the assertion that the various outcrops of coal met with over this area and at widely separated points, (such as Clones, the Washedemoak, Ottnabog, Little River, Nashwaak river, etc.) belong to the same seam as those at Grand Lake, though there are facts which favor such a supposition; there is, however, no reason to doubt that those in the neighborhood of the last named lake are all of the same seam, and that consequently the area over which it may be safely regarded as extending is a very considerable one. Thus the area of the Newcastle coal field (adopting the position of the actual coal openings as marking its limits about thirty two square miles; that of Salmon River as also about thirty two square miles; while that of Coal Creek is about forty eight square miles, making a total for the three of about one hundred and twelve square miles. Adopting twenty inches as the average thickness of the coal seam, and 79.4 lbs., as the weight of a cubic foot of coal, (the specific gravity being 1.27) and deducting one-fourth for the areas occupied by Salmon River and Grand Lake, the total amount of coal within the areas in question would be (at the rate of 2,000 lbs. to the ton) not less than 154,948,147.2 tons. ""It is, however, to be observed that the true area of the coal fields in question, and more particularly that of Newcastle River, is probably much larger than has been stated above; the line which has been chosen as marking its western limits really indicating only the point where the rocks of the Middle coal formation pass beneath those which form the highest member of the Carboniferous system, and under which they could probably be reached at no great depth. The occurrence of a coal seam on Little river in Sunbury county, having about the same position and thickness as those of Newcastle, render this supposition highly probable. Moreover, the thickness of the coal beds at Clones does not differ very greatly from that of the beds at Grand Lake, and it is not improbable that a large part of the area occupied by the barren measures at the base of the Middle Carboniferous formation, or rendered unavailable by being covered with lakes, the possible total yield of coal from a seam of twenty inches covering the remaining area would be not less than 5,510,436,357.12 tons. Setting aside, however, this supposition as confessedly based upon too imperfect data, we can still hardly doubt that the area over which the principal seam of coal in the Grand Lake region may be reasonably supposed to extend, is at least two or three times greater than that employed in the above calculations, and that therefore the estimate of its productive capacity may be fairly increased in a corresponding ratio.""'

Daily Telegraph - Aug. 26, 1876 The Woods and Minerals of New Brunswick. - A few copies of this valuable pamphlet, by Professors Bailey and Jack (the latter professed forestry, mineralogy, etc.) is on sale at Jones & Morrisons."
S.J. Daily News - Jan. 4, 1876 Mr. Napier's Lecture on Minerals and that sort of thing is to take place at Bathurst on Thursday evening. His note of acceptance to the invitation to lecture is as follows:-Gentlemen.- I have much pleasure in complying with your very kind request, and wish to name the 6th January at 8 o'clock, p.m., when I trust I shall be adequate to the pleasure. Please inform me at what place I am to meet and circulate the fact to the best of your ability, I am yours truly, Samuel H. Napier Bathurst 28th Dec., 1875"

Codes: GEOL / IDX_Names: Geology - General;
S.J. Daily News - Jan. 10, 1876 Mr. Napier's Lecture. - The lecture of Mr. Napier on Minerals and that sort of thing, which was to have taken place at Bathurst on Thursday evening last, was postponed on account of the severe storm which prevailed on that night. A number had collected at the hall notwithstanding the weather, and tried to prevail on the

Committee to get Sam to mount the rostrum, but after some parleying it was thought best to postpone the lecture until some evening this week, especially as it had been circulated during the afternoon that it would not take place unless the

Daily Telegraph - Jul. 19, 1876 ADVERTISEMENT: Charles Robb, (Late of the Canadian Geological Survey), Civil, Mechanical and Mining Engineer. Patent Solicitor, (The International Patent Agency) 22 St. John Street, Montreal. Patents secured in Canada and all Foreign Countries; Mechanical, Architectural and Map Drawings; Surveys, Plans and Reports of Mineral Properties. References:-A.R.C. Selwyn, Esq., F.G.S., Montreal, Director of the Geological Survey. Dr. T. Sterry Hunt, F.R.S., F.G.S., Institute of Technology, Boston, Mass. Prof. J.W. Dawson, LL.D., Montreal. T.C. Keefer, Esq., Ottawa City. Walter Shanly, Esq., C.E., M.P.P., Montreal. Prof. E.J. Chapman, Toronto."

Daily Telegraph - Jul. 19, 1876 (see Sep.1 issue) Mining Engineering. - The card of Mr. Charles Robb, C.E., brother of the late Dr. Robb; will be foundin our present issue. Mr. Robb has long been identified with Geological and Mining explorations in Canada, and must be presumed to be one of the most competent mining engineers in Canada. He is also a solicitor of patents, etc., etc."

Carleton Sentenil - Jun. 17, 1876 There is near McAdam Junction a rather singular natural production, or phenomena, worthy
a visit by anyone interested in the particular branch of study to which it belongs. On a very large, flat faced rock, the surface being some 15 feet across, lies another rock, oval in shape, weighing probably several tons, so poised as that a slight pressure causes it to tip several inches, always returning, by its own weight, to its ordinary position, and yet it would require an immense force to displace it entirely and throw it from the foundation on which it has een placed by, we suppose, the action of the ice in the glacial period."

Daily Telegraph - Sep. 4, 1876 Personal: Professors Bailey and Ells have returned to St. John from the geological survey of Albert and Westmorland."

S.J. Daily Globe - Sep. 21, 1877 and Morning Freeman - Sep. 22, 1877 Geological Surveys. - Prof. Bailey, of the N.B. University, who has been making a geological survey ofportions of St. John and King's Counties, returned last, to resume his duties at the University. Mr. Broad, Prof. Bailey's companion, joins Mr. Ells, who continues the explorations. We believe, that, so far, their investigations have not been very prolific of rich mineral deposits."

Daily Telegraph - Apr. 9, 1878 The Late Professor Hartt. - Sir, - The many St. John friends of the late Prof. Chas. Fred. Hartt may have some interest in reading over the following slight account of the discoveries made by that distinguished geologist in Brazil. It was about the year 1860 or '61 that Prof. Hartt, then only 21 years old, left St. John for Cambridge, Mass. to enter there the Agassiz Museum. During the following three years he studied under the care of the far-famed Swiss naturalist, returning, however, every vacation, to continue the exploration of his native province. In 1866 Prof. Agassiz organized the well-known Thayer Expedition to Brazil, and Hartt was made one of its geologists. He spent over a year examining the country between Rio de Janeiro and Bahia and, though this tract did not present many points of geological interest, he became convinced that Brazil needed a geological explorer, and he determined to attain that position. He returned to Brazil alone in 1867 and spent some time both to the N. and S. of Bahia, discovering several regions of fossiliferous rocks of great interest, and carefully investigating the reefs of the coast. Of these he proved there were two kinds, the coral and sandstone reefs, the latter king formed by the consolidation of beaches, from behind which the loose sand is afterwards removed by currents. The sandstone reefs are all closely fringing, and occur only along the shore; the coral reefs are very diverse and extensive. In 1868 Mr. Hartt was appointed Professor of Geology in Cornell University, Ithaca, N.Y., which position he still held at the time of his death, and in 1870 he published his Geology and Physical Geography of Brazil, containing the results of his two trips to that country. A third and very important trip was made by him in 1870, when accompanied by Prof. Prentice and eleven students of Cornell, he discovered in the Amazonian valley the very extensive paleozoic, Devonian and carboniferous deposits, full of fossils, and also the fossiliferous secondary deposits near Pernambaco. He examined the above localities again on his fourth trip in 1871, on which he was accompanied by only one assistant, and made many new discoveries. On the first of May, 1875, there was organized the Geological Commission of Brazil, and Prof. Hartt was made its chief. The Brazilian government had finally decided that it needed to have its natural resources examined, and it could find no other man so qualified for the position as was Prof. Hartt and he was thus called to their assistance. His survey had been in commission nearly three years when his sad and sudden death severed him from its further workings. In the course of these explorations he had been successful in working out the entire geological structure of the lower Amazonian Valley, and of the entire coast line; the coal regions of Southern Brazil and many of the mining regions of Minas Gerais but we could not give a clear idea of what Prof. Hartt has done for Brazil during the past few years short of many pages, suffice it to say that his reports, yet mostly unpublished, are very voluminous and from a most valuable contribution to science, dealing, as they do, of the geology, zoology and ethnology of one of largest and least known of the countries of the world. Eastport, April 4th. R."

Codes: GEOL / IDX_Names: Geology - General;
Daily Telegraph - May 11, 1878 The Late Professor Hartt. - The New York Tribune contains a very interesting and

appreciative account of the labors of the late Professor Chas. F. Hartt, in the exploration of Brazil. We are happy to observe that the results of these labours is shortly to be published. Professor Hartt, as the Tribune truly says, has not lived to see the good of his labours, but he has left behind him a monument of his own building such as remains to the

Morning Freeman - Oct. 14, 1878 Exhibition. - Mineral. - The judges report as follows: The collection of Prof. Bailey is the only one consisting of New Brunswick minerals. It is a very fine collection and deserves the first prize: we could also make honorable mention of the fine collection of minerals and Cretaceous fossils, exhibited by Mr. Reid."

S.J. Daily Sun - Aug. 23, 1879 and S.J. Daily Telegraph - Aug. 23, 1879 Geological Survey. - Mr. George F. Matthew, of the Customs Department, is to commence shortly a series of geological surveys of the rock formations, etc., in the vicinity of the Tobique, for the benefit of the Government. About three weeks will be consumed in the undertaking. We shall be pleased to hear Mr. Matthew report, feeling sure that our readers will peruse it with satisfaction. - Tel."

Daily Telegraph - Jan. 7, 1879 Professor Bailey, last evening, recognized infitting terms the good work being done by Mr. Best in connexion with the Museum of the Institute. The Professor's lectures should give an impetus to the study of chemistry, for which Mr. Best has organized classes."

Daily Telegraph - Jul. 8, 1879 The Boulder District of New Brunswick. - By Edward Jack. - It is exceedingly important to settlers toavoid inferior lands, and to make good selections. The following notes will, I hope, have at least a negative value in this connexion. Commencing at the shores of the great Schoodic Lakes, and extending in a northeasterly direction across the province, we find the surface of the country covered with masses of granite, of all sites, from that of a block weighing a few pounds, to one of many tons in weight, lying so thickly together that in some instance one can walk on them for a mile or more without so much as setting foot on ground. This district averages more than 10 miles in breadth, and 100 in length. Its breadth, as crossed diagonally by the New Brunswick and Canada Railway, is about 20 miles, and any one who has ever travelled that road will remember its appearance. Among these boulders many lakes occur, and no more dreary scene can be met with than these and their surroundings, when, as is often the case, the grim rocks have been denuded of their moss and overshadowing trees by the desolating fires which have done so much injury to our forests. In the calm summer evening the gloom and silence of these lakes and their shores is distressing. No merry birds enliven the feelings by their sweet songs. All the sounds which reach one are of a melancholy character. Now and then one hears the shrill piping of the frog; the sad call of the loon to his lonely mate, or the startled cry of the ever watchful black duck, giving notice to her young that the enemy, the owl, is approaching; or, perchance, the harsh chatter of the king-fisher (miserabiles avis, mournful bird, as the Latin poet calls him), as, suspended in mid-air by the quick motions of his wings, he hovers over his intended prey. Kilburne Lake is an example of one of these sheets of water. From its bosom every here and there spring great grey rocks, sometimes showing a large surface, at other times only reaching a few inches above the water, and again lying a few inches below it, so that great caution is required in navigating a bark canoe among them. The country to the west of this lake was once covered by a forest of as magnificent pines as ever grew on any part of the St. John River. A friend of mine making timber, many years ago, not far from this lake, told me that he paid $4 per tree stumpage, and that he never got a better bargain. The axe and fire have now, however, done their work, and only here and there a tall grey tree, leafless and branchless, stands a solitary monument among the stunted shrubbery to mark where once this forest stood. Around the lake are neither pleasant sounds nor sights; as if to help the monotony of the scene, a fish may be seen jumping at a fly on the surface, and one may amuse himself by watching the expanding circles. I have often slept beside the shores of large lakes, sometimes under shelter, sometimes without, and when the wind arose have listened with pleasure to the measured beat of the long-rolling waves as they swept up on the sand beach. But to the weary traveller who rests beside this lake there is no cadence, no music in its waves, as they dash first against one rock, then against another, until the sounds become so confused that it is dash, dash, dash, splash, splash, each wave giving out its peculiar sound as it struck against larger or smaller rocks. There are no pleasant camping grounds around this lake; no smooth and gravelly beaches where one can wade out and cool his feet; everything about its edge is abrupt, and you can only reach the water from some boulder whose sides are fringed by a few scraggy shrubs. The water itself looks black, no white pebbly bottom; nothing but rocks everywhere. It was on the surface of the boulder district that our best forests of black spruce grew fifty years ago. Its wealth was enormous, and even now, where it crosses the Nashwaak and Miramichi rivers, there are great quantities of this valuable wood. I have more than once stood and counted two thousand feet of spruce standing on an acre which, at the present rate of Government stumpage, 80 cents, would represent a value of $8. There never was a sounder our better growth of pine than that which Senator Glasier hauled many years ago from the Shogomoc. There is one road down that stream on which timber must have been hauled for more than 20 successive years. This good quality of wood must have been dependent for its growth on the salts of potash resulting from the decomposition of the feldspar of the granite. Small parts of the district have the requisite amount of earth to support the growth of plants and vegetables, and, where it crosses the St. John, the surrounding soil is very good, especially for the growth of apple trees. I remember passing through the yard of one of Mr. Glasier's old camps near Charley Lake and discovering a fine apple tree laden with fruit. The taste was, however, harsh and sour. This tree no doubt derived its origin from the seed of some apple which had been dropped there. When we talk about the extent of our agricultural lands we must expect 1,000 square miles covered by the boulder district. Too little attention has been paid to the geological structure of the Province in the location of our roads and settlements. Had more heed been given to

Professor Johnson's able and excellent report, the Intercolonial Railway would not have run through 100 miles of land

Codes: GEOL / IDX_Names: Geology - General;

S.J. Daily Sun - Jul. 16, 1879 Geological Survey. - Wallace Broad, Esq., Dominion Geological Surveyor, has been prosecuting his surveys in this Province during the past spring. His route this time has taken in the western side of York county along the St. John River as far as the centre and the southern part of Carleton County. His headquarters have been of late at Debec Junction, where ha has been pleasantly located, living under canvas. Mr. Broad has been accompanied in his tour by Prof. Bailey of the N.B. University."

Carleton Sentenil - Jul. 19, 1879 Mr. Wallace Broad, Geological Surveyor for the Dominion Government, and who is now engaged in surveying certain portions of York and Carleton Counties, has his tent pitched in a delightful situation near W.D. Smith's, a portion of last and of the present week. From Woodstock Mr. Broad removed to Debec. For a considerable portion of the time lately Prof. Bailey, of the University, has been accompanying Mr. Broad."

S.J. Globe - May 14, 1879 The Geological Survey of Canada, has presented, through T.H. Rand, Esq., Supt. Of Education, to the St. John School Board, for the use of the Girl's High School, one hundred and seven specimens of rocks, etc. illustrating the geology of Canada. The gift is both a valuable and a useful one."

S.J. Daily Sun - Nov. 13, 1879 Prof. Bell, of the Geological Survey, has returned here after a six month's surveying trip to the Northwest Territory. He brings samples of gold, silver and other minerals found in the territory, and claims to have made several important discoveries which will not be disclosed to the public until he has made his report to the Government. - Tel. to evening papers."

Daily Telegraph - Nov. 19, 1879 Halifax, Nov. 18. - The General Council of the Provincial Miners' Association of Nova Scotia and New Brunswick met at Westville on the 14th inst., in the interest of the miners of Drummond Colliery who were, withput notice, subjected to a reduction of wages. The Grand Council refused to tolerate the action of the Drummond managers, and after some deliberation advised the men to oppose the action, and promised them the support of the Grand Council. Fortunately, however, this misunderstanding will not be attended by any detrimental results, as it has been settled between the masters and men."

Daily Telegraph - Oct. 7, 1879 Geological Excursion. - Prof. Bailey and the students of the senior class had a geological excursion on Saturday last. Armed with hammers and other implementsthey went up on the New Brunswick Railway line as far as Rockland, where they got off and spent the day hunting for specimens and obtained some very valuable ones. All enjoyed themselves very much, and acquired much practical knowledge of the subject of Geology."

N.B. Reporter - Oct. 15, 1879 The St. John River. - Mr. Edward Jack of the Crown Land Office has been visiting St. Andrews, and has lectured in Stephenson's Hall in that town, his subject being On the (upper) St. John River. We should judge by the accounts contained in the press of that town, that the lecture was both instructive and interesting. Among other things Mr. Jack stated (we quote the Pilot) that inthe year 1763 the first permanent settlement on the St. John River was made at Maugerville, by about 800 men, women and children, under the guidance and superintendence of Mr. Israel Perley grandfather of Hon. W.E. Perley. Says the Pilot:- The lecturer described the geological formation of the banks of the St. John river, which he said comprised the older rocks at its mouth, north of this came in the coal formation, which bore the poorest land in New Brunswick, above this came the Upper Silurian, on which rested the richest and most fertile soil which is similar to the most productive districts in Western New York, and of which the New Brunswick Railway Company own nearly a million of acres. The projector of this railroad Company, Mr. Alex. Gibson, is a native of St. Andrews, and he is a man of which any town may feel proud. The lecturer exhibited a Geological map of New Brunswick, on which he pointed out the lines marking the bounds of the different geological formations. He then introduced a transparency, showing the splendid forest growth on the upper Silurian formation in New Denmark, which settlement he said was much indebted to the persevering labors of one of Charlotte County's representatives, The Hon. Benjamin R. Stevenson. A number of transparencies of scenery on the upper St. John and its branches, many of them very realistic and beautiful, were introduced, and were deservedly admired by the audience. For the amusement of the young folks several comic transparencies were shown, and were admired by all. These transparencies were the work of Mr. Geo. Taylor, of this city, and were prepared from photographs by himself. They were exhibited by aid of a Magic Lantern and Oxi-calcium light, and are spoken of as highly creditable. There is nothing more interesting or entertaining than a reproduction of reminiscences of the early days of our country, and we have few gentlemen among us capable of presenting them to the public in a true and pleasant manner as Mr. Jack, who we hope may be induced to appear before a public audience in this city, and favor them with his lecture."

S.J. Daily Sun - Aug. 31, 1880 Fossils, minerals, &c. - Jas. Milligan, Esq., has presented the Museum of his native town in Scotland, on behalf of the N.B. Natural History Society, with a fine collection of the fossils and minerals of this

Codes: GEOL / IDX_Names: Geology - General;

Daily Telegraph - Dec. 8, 1880 Natural History Society. - The members of this association met last evening to hear Mr. Hay's biography of Prof. C.F. Hartt, who had been for a long time a member of this society and had done much for its prosperity in its earlier years. After the meeting had been called to order some donations of books were presented and in connection with one of them specimens of insect remains, collected by Prof. Hartt, were shown. The secretray reported that the council had appointed a committee in the matter of a memorial for the Loyalists in 1883. Mr. Hay then read his memorial sketch of the life and work of Prof. C.F. Hartt, describing his early life in Nova Scotia, his geological work in St. John and his studies at Cambridge under Prof. Agassiz. How he afterwards went with that famous naturalist to Brazil and thus began the important work in that country, where he spent the best years of his life. It was not in geology alone, but in the study of the history and civilization of the aboriginal races of that country, that he made important discoveries and earned for himself a lasting name and fame. The amount of work that he accomplished during his alas! too short, but brilliant career was described as enormous, writing voluminous books and reports and carrying on a large correspondence, besides pushing his original researches in science. As a native of New Brunswick, and having done so much towards increasing a knowledge of the remarkable geological features of the country, he deserves to hold a high place in our esteem. His attainments were such as any country might be proud of, and in his death science lost one of her foremost men. Not yet arrived at middle age, with all the enthusiasm of youth still upon him, with his life work giving promise of a glorious fulfillment, it seems only human that a pang of regret should mingle with our thoughts of him, and of what he might have accomplished had his life been spared. While in the midst of his work he was cut off by yellow fever on returning to the coast from one of his expeditions to the interior of Brazil, having died in March, 1878."

S.J. Daily Sun - Feb. 17, 1880 and S.J. Daily Telegraph - Feb. 17, 1880 Matthew lecture entitled - Physical Features of the Bay of Fundy ... long...."

S.J. Daily Telegraph - Jun. 2, 1880 Natural History Society .... Matthew and Chalmers......"
Daily Telegraph - Jun. 15, 1880 Geological Explorations in New Brunswick. - The geology of New Brunswick has not yet been carefully studied except perhaps in the southern counties. Previous to Confederation, in 1867, a large portion of the work of exploration was done by amateurs of the science, namely,by Doctor Gesner and Robb, Professors Bailey and Hartt, Mr. G.F. Matthew, and others, although Professors Robb, Bailey and Hind each made surveys and published reports at the instance of the Provincial Government. After Confederation the Geological Survey of Canada was extended to the Maritime Provinces, and Messrs. Bailey and Matthew have spent a portion of each summer since in exploring the intricate structure of the southern counties, and in examinations of the coal field. Mr. R.W. Ells of the Survey has assisted them materially in their labours, having worked out the distribution of the Albert shales and aided in solving some other problems in the geology of the district bordering on the Bay of Fundy. The section more particularly examined by the Survey is that lying south of the carboniferous area, including the counties of Charlotte, St. John, Kings, Queens, Sunbury, Albert, a portion of Westmorland, and portions of York and Carleton. Mr. Ells examined the Baie de Chaleur region during the summer of 1879. The interior of the Province, or that part lying west of the coal field, including the counties of Madawaska, Victoria and portions of Carleton, York, Northumberland, Gloucester and Restigouche, being almost entirely a wilderness country, have not yet been explored in detail, and except in the somewhat hasty reconnaisance of it made by Professors Robb, Bailey and Hind, already referred to, by which its rocks have been correlated in the southwest with the formations in Maine, and on the north by those in the Gaspe Peninsula, it is a terra incognita to the geologist. A vast amount of labour has been expended in unravelling the structure and relations of the metamorphic and crystalline rocks lying south of the coal area; and it is mainly to the labours of Messrs. Matthew and Bailey that science and the country are indebted for the thorough and systematic survey of this section of the Province. Their reports to the Director of the Geological Survey, published from year to year by the Government, embody full details regarding the arrangement, stratigraphy, and fossil remains of the sediments of this region, the study of which has thrown considerable light on the geology of the remaining portion of New Brunswick, and added a number of new facts to science. Thus step by step, slowly but yet surely, is the knowledge of the very interesting series of rocks which underlie the Province with the marvellous history they relate, becoming unfolded, and though so much of our country still lies comparatively unexplored, yet enough has been done to show that not only is its geology replete with interest to the student of Nature, but that it contains deposits of minerals of great economic importance. We cannot, it is true, boast of such extensive coal beds or rich gold miners as our sister Province of Nova Scotia, but we have the famous albertite of Albert and Westmorland counties, the coal mines of Queens county, fairly productive, the antimony mines of Prince William, and the manganese mine at Markhamville, both worked at a profit; besides the vast deposits of iron ore in Carleton county, and the copper, silver, lead and manganese ores in many other localities in the Province, all awaiting the aid of enterprise and capital to develop them."

Daily Telegraph - May 5, 1880 Natural History Society. - ... Mr. W.F. Best read a suggestive essay on The Undeveloped Resources of New Brunswick, which brought out a very interesting conversational discussion on the economic minerals found in the Province. Mr. Matthew explained the nature and origin of the Lepreaux anthracite, and the albertite of Hillsboro, and General Warner and others also made some interesting observations regarding the occurrence and quality of our ores. The opinion seemed to prevail that the mining interests of New Brunswick would be taken hold of in the proper spirit before long. Mr. Best stated that within five years chemical factories would be started in the Province. The next meeting takes place on the first Tuesday in June, when Mr. R. Chalmers will read a paper entitled Notes on the Botany of New Brunswick."

Codes: GEOL / IDX_Names: Geology - General;
N.B. Reporter - May 12, 1880 Grand Falls For the Tourist. - By F.H.E. - (No. 11) - Bird, a somewhat eminent Scottish geologist whose vocation has made him a wanderer in many lands, having explored the bowls at the foot of the Chaudiere Falls last summer, made no reference whatever to their primal formation, but stated that the glossy character of the sides was caused through fragmented rock whirled by eddies. This explanation seems also to apply in regard to the wells at Grand Falls. On investigating the interior in the spring time, immediately after the recession of the freshet, the gravels and pebbles which lie at the bottom are found to show signs of having been subjected to a whirling motion by the water, which for a short period at this time of the year flows completely over the point. The larger pebbles are found grouped in a circle close to the outer edge. The most remarkable evidence in favor of this theory is that whereas the surface of the sides nearest the bottom, is smoother than further down, there and less visible inequalities at the bottom. This state of affairs, I think, may be explained by supposing that the upper portion was smoothed by water alone. At the bottom the rocks while more effectually removing theinequalities would not have tendency to produce the same degree of glossiness as above. Descending the wells by means of ladders, the interior is found in every case to be nearly circular, as smooth and symmetrical as though polished by the most skilled artificer. From the wells by natural terraces winding around the side of the cliff, after a short walk (or climb) up stream the perspiring traveller reaches another jutting point about whose honey combed base the water dashes and leaps with great force and turbulence. From this coign of vantage a splendid view is obtained of the numerous rapids and waterfalls in the river above and below. .... At this point the geologist and specimen hunter may feast his eye and exercise his chisel on some of the most perfect petrifactions to be found in America. The lobes of two immense petrified trees, apparently broken sharp off, extending a few feet above the surface, about six feet in diameter, are here to be seen. The grain, rings and bark are shown with wonderful clearness. The rock at this point and in the vicinity abounds in remarkable specimens of vegetable and animal petrifaction. Fossil snakes, toads and turtles and other phytolites have been frequently procured here, and even now (or during the writer's stay) there is to be seen in full view upon the smooth surface all that is vicious looking of a snake much larger than any now to be found alive in the Province. From the extremity of this promontory a beautiful sight is had of the suspension bridge above, which, 130 feet from the water's edge, stretches its gossamer-like proportions across the gorge, outlined against the northern sky. Passing round or over this point the dark interior of an enormous cavern, fully thirty feet in height, a short distance from the waters edge scooped right out of the massive cliff, looms up in view. In summer this is the abode of bats and owls. In winter huge icicles remain frequently until the month of June. A pistol discharged in this cavern is almost certain to detach pieces of rock from the roof or sides. .... Still lower down the eddying tide forms an immense whirlpool called the Coffee Mill. In the funnel shaped rock bound interior of the coffee mill, logs which come over the falls during the lumbering season, (between May and the first of July), from the drives above, remain sometimes for days, and by incessant friction between themselves, and contact with the jagged rocks, are gradually crushed to match wood. The depth of water in the coffee mill varies according to the pitch of the river from 300 to 350 feet. When its gaping jaws are filled with rapidly revolving logs the din may be heard for a long distance above the noise of the Falls and rapids. ...."

S.J. Daily Sun - Nov. 8, 1880 Mr. Wallace Broad, of the Dominion Geological Survey, on the eve of his departure to Montreal, entertained a number of his friends at the Queen Hotel, Fredericton, Friday night, and the occasion was quite anagreeable one. Mr. Broad left for St. Stephen on Saturday, where he will remain till the 22nd inst., then proceeding to Montreal to rejoin his Department."

St. Croix Courier - Nov. 11, 1880 Personal. - The Sun of Monday has the following: Mr. Wallace Broad, of the Dominion Geological Survey, on the eve of his departure to Montreal, entertained a number of his friends at the Queen Hotel, Fredericton, Friday night, and the occasion was quite an agreeableone. Mr. Broad left for St. Stephen on Saturday, where he will remain till the 22nd inst., then proceeding to Montreal to rejoin his department. We are glad to have Mr. Broad amongst us. He is a young gentleman who has made his mark in the profession he has chosen and is a credit to New Brunswick. We learn from the Maritime Farmer that he has spent the most of the summer and autumn, in York County, examining its geological structure, and making surveys preparatory to the publishing of a map by the Department."

Daily Telegraph - Oct. 7, 1880 Our Minerals. - Except as regards the combustible minerals, and also iron, gypsum, etc., we have not been wont to attach much value to our minerals. But the notices which we publish today, treating the specimens shown in reference to the geological strata in which they are found, is very suggestive and gives the idea that we may yet hear much more about our minerals than heretofore. This is pretty sure to be true of antimony; possibly also of

Codes: GEOL / IDX_Names: Geology - General;
Daily Sun - Oct. 29, 1880 The Secrets of the Rocks. - Fossil Fishes from Baie Des Chaleurs. - At a meeting of the Natural History Society of Montreal held on Monday evening (says the Gazette), Mr. Whiteaves, at the invitation of the chairman, read a paper on Some new and remarkable fossil fishes from the Devonian rocks of the northern side of the Baie des Chaleurs. He commenced by remarking that until last year a long strip of the northern side of the bay had been mapped as belonging to the conglomerates of the Bonaventure formation, which form the base of the Carboniferous system. Last summer, however, Mr. R.W. Ells, of the Geological Survey, discovered a fine specimen of a fossil fish belonging to the genus Ptericthys, of Agassiz, in Escuminac Bay, a discovery which led to a careful re-examination of the locality by Messrs. R.W. Ells, T.C. Weston and A.H. Foord. From the researches of these gentlemen, we now know that at this point

an anticlinal axis of Devonian rocks crops out from under the Bonaventure conglomerates, and further, that these Devonian rocks hold a rich and extremely interesting series of fossil plants and fishes. The vegetable organisms will be reported by Principal Dawson at some future time, but the fossil fishes, of which many specimens were exhibited at the meeting, were shown to belong to the following genera and species: - 1. Ptericthys. A fine species, supposed to be new, which has been described in the August number of the American Journal of Science as Ptericthys Canadensis. It is very closely allied to a fossil fish found in the old red sandstone of Scotland and Russia, and is the first species of this remarkable genus yet found in America. 2. Diplacanthus. A cluster of fin rays only, of a small form, unquestionably referable to this genus. 3. Cheirolepis. A beautifully preserved fossil fish, about a foot in length, which cannot at present be distinguished from the Cheirolepis cumingiae of Agassiz which was so named in honor of Lady Gordon Cuming, of Altyre. 4. Glyptolepis. Three species. One with very large scales, nearly related to the G. leptopterus of Agassiz, and another, with very small scales, more like the G. microlepidotus of the same author. The third is probably new. 5. Holoptychius. One species, possibly the same as some isolated scales of a Holoptychius from the Catskill Group of Tioga County, Pennsylvania, described by Dr. Newberry as H. Americanus. 6. Portions of the vertebral column of an unknown fish, (possibly of Holoptychius) shewing the neral and haemal spines and the processes which support the rays of the tail, also the two ischiatic bones with the metatarsals attached, which must have formed the base of two enormously developed ventral fins. The structural characteristics of the different specimens exhibited were described and explained at some length. Mr. McFarlane asked whether these fishes were air breathing animals, whether atmospheric oxygen was essential to their existence. Mr. Whiteaves replied that the inference was they breathed through their gills like ordinary fishes. Of course only the hard parts has been preserved and there was nothing to show they had gills. Mr. McFarlane explained his reasons for putting the question. At that period there was such a large proportion of carbon in the air, the accumulation of which made the coal of the carboniferous period, that there must have been a deficiency of oxygen. The chairman said this raised a very interesting question, and he proceeded to treat it at some length. Whatever opinion might be entertained of the theory, there must no doubt have been sufficient oxygen in the air for animal life, since butterflies were found in periods before the carboniferous. There was nothing to prove that these fish had not a rudimentary lung through which they inhaled oxygen like reptiles, as well as through the gills. He concluded by expressing the great obligations the Society were under to Mr. Whiteaves for his excellent paper, and stating that the specimens were a feather in the cap of the Geological Survey, being on a par with the fishes discovered in the old red sandstone of Scotland. The secretary moved a vote of thanks to Mr. Whiteaves, which was unanimously adopted. Fifteen specimens were exhibited, all of which with one exception were discovered by Messrs. Foord and Ells. Several lithographs illustrative of the subject were also exhibited."

Bay Pilot - Sep. 2, 1880 The Carleton Sentinel states there is near McAdam Junction a stone of several tons weight, poised on a large boulder similar to the rolling stones to be seen in Ireland and elsewhere."

Daily Telegraph - Sep. 21, 1880 Exhibition. - Minerals: Phillips & Williams: 1 piece marble representing basket flowers. O'Neill, John & Co.: Monumental and ornamental specimens."

Daily Telegraph - Aug. 25, 1881 The Waste From Gas Works. - Mr. W.F. Best, Dominion Assayer, etc., in reference to statements and correspondences recently published in the Telegraph sends us the following. In Europe the value of the residual products fromgas works is usually equal to 50 per cent of total cost of coal employed. One European gas company that consumes 50,000 tons of coal per annum produce 6,000 casks of Ammoniacal liquor which sells for over $10,000. This ammoniacal liquor is the source of nearly all the ammonia salts of commerce. Ammonia sulphate, which is extensively used in agriculture as a manure, is prepared from gas liquor. The treatment of gas liquor for this purpose constitutes a remunerative branch of manufacture. The following is an outline of the process employed:- A pipe conveys the gas liquor to a boiler placed over a fire. This boiler is covered, and a pipe extends from the cover to the bottom of a vessel containing sulphuric acid. When the contents of the boiler are heated the ammonia is driven off and carried into the vessel containing sulphuric acid, where it is absorbed and the resulting product is crude ammoniac sulphate. In this state it

S.J. Daily Sun - Feb. 2, 1881 Natural History Society - geological history ...."

Codes: GEOL / IDX_Names: Geology - General;
Daily Telegraph - Feb. 2, 1881 Natural History Society. - The regular monthly meeting of the Natural History Society was held in theirroom in the Mechanics' Institute, last evening, the president, Dr. Botsford, presiding. It was decided to hold a conversation in about a fortnight. Mr. G.F. Matthew addressed the meeting on Forty-Two Years of the Geology of New Brunswick. He reviewed the work and opinions of Abraham Gesner, who wrote five reports, which were presented to the Provincial Legislature. In his first report he described the geology of the coast from St. Stephen to St. John and up the St. John River. The work of his second report was the examination of the coast eastward from St. John to the Petitcodiac and the interior to Westmorland and Albert. The third report considered the carboniferous region, Grand Lake, etc. His next year was devoted to an examination of the region from St. Stephen to Woodstock and thence to the Miramichi. The fifth report dealt with the Upper St. John, the Restigouche and Tobique. As regards the topography of the country he speaks of two granite regions from St. Stephen to Shepody Mountain and from some Charlotte county lakes to the Keswick. He also speaks of granite at the mouth of the Nepisiguit. Then the study of geology was in its infancy and the earlier writers had crude notions. In 1658 Rev. Dr. Hook put forth the idea that organic remains might, if studied, give a chronology of the

world. In 1775 we met with a man who had then immense influence on geology - Werner, a professor in Freiburg, Saxony. Men flocked from all parts of the world to hear him. His idea was that the formations were deposited all over the earth. His idea in regard to geology extended after his death. In 1788 arose Hutton in Scotland. His idea was that the present earth consisted of remains of a former earth. After these men there was a more systematic study of the fossils in the different strata. Mr. Matthew then referred to the labours of Dr. Robb, in 1850, and compared his views of the rocks in this Province with Dr. Gesner's. In 1860 he (Mr. Matthew) began work on formations around St. John, and later Prof. Hartt also worked similarly, while Prof. Bailey worked in the rocks about Fredericton. In 1865 there was a Provincial survey, and Mr. Matthew pointed out the result of this work. He spoke of the utility of this study and also touched on surface geology, and the advantage of knowledge of this subject in drainage of lands and digging wells, etc. At the close of his very interesting address, which was illustrated by maps, Mr. Matthew answered a number of questions propounded by the members of the society. A vote of thanks was then passed to Mr. Matthew for his lecture and the society adjourned."

S.J. Daily Sun - Feb. 22, 1881 Surface Geology. - An interesting talk will be given by G.F. Matthew, Esq., this evening in the lecture room of the Young Men's Christian Association,the subject being Surface Geology. Any person wishing to attend can obtain tickets free by calling at the Secretary's office any time before the lecture."

S.J. Daily Telegraph - Feb. 23, 1881 Surface Geology. - The lecture in the YMCA parlor, last evening, on Surface Geology, by Mr. G.F. Matthew, was very well attended and a valuable amount ofinformation was given. At the close of the lecture Mr. Matthew answered a number of questions on the subject of the lecture."

S.J. Daily Sun - Feb. 23, 1881 Mr. Geo. F. Matthew's lecture in the Y.M.C.A. hall last evening on Surface Geology was very instructive. At the close, Mr. M. answered a number of questions evolved by the lecture."

Daily Telegraph - Jan. 22, 1881 New Brunswick Mines and Minerals. - In the matter of mining and mineralogical explorations, reports and information, Nova Scotia is much in advance of New Brunswick. There is in the city of Halifax a Provincial Museum, of which Dr. Honeyman is curator. There is to be seen a collection of all the metals and minerals hitherto discovered in that Province; this is open to the public, and any one desirous of prospecting in any locality can not only see the ores and minerals gathered from it but can also receive valuable information from the learned and polite curator. The Inspector of Mines for Nova Scotia, Mr. Gilpin, has lately published a valuable report, replete with information and much sought after by those interested in mining in that province. In New Brunswick we have no geological map of the Province, though such a map is very needful for the explorer of minerals, since it shows him the place in which minerals or metals are most likely to be found and thus saves him the necessity of spending valuable time in unpromising localities and enables him to concentrate his energies upon places which present a fair prospect of giving him some return for his labour. We are deficientin condensed information upon the minerals or metals of the Province and any one in search of this has got to hunt through the Reports of Dr. Bailey, Prof. Hind and those of the Geological Survey of Canada in which they found the work of Mr. George Matthew of our city. The map is also needed for the purposes of Agriculture and colonization. What we want therefore is a geological map of New Brunswick on a good sized scale and on which should be located the position of all of the mineral veins or beds discovered up to this time, as well as showing formations and soils. This should be supplemented by a short pamphlet compiled from the various issues of the Geological Survey of Canada and from any other sources of information which might be at the time accessible. This summary should also give the names of the places where minerals, building stones, clays and the ores of any metals have been heretofore discovered. It should be written in plain language, free from technicalities so far as possible, so that any ordinary reader would find no difficulty in understanding it. It should be useful to the farmer as well as to the miner. By these means the public would be put in possession of all the information which we have regarding the Geology of the Province, and the result would, we feel assured, amply repay any expenditure which might be incurred. We cannot expect people from abroad to direct their attention to our resources unless these be made public. The merchant, when he has any wares to dispose of, advertise them, and we, if we wish our mineral wealth to be known by the world, must do the same."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Daily Sun - Jul. 6, 1881 Natural History Society. - .... Field meeting held in Torryburn ..... Mr. Matthew then followed, describing the results obtained by the geological section of the field meeting from a study of the surface deposits of the Torryburn valley, and of the valuable marl beds which border the lake. These deposits began as soon asthe land rose high enough to exclude the sea water which had formerly filled the valley, and since then had been piled up in the basin to a depth of seven feet in many parts of it. Some of the shells which are plentiful in the marl are very rare in the lake at the present day, and one that is very common in the lake now is entirely wanting in the marl. The beds of marl in the lake have been exposed to view by the drainage of the lake in connexion with the building of the Inter-Colonial Railway. ..."

N.B. Reporter - Jun. 2, 1881 Messrs. Wallace Broad, and Wm. McInnes, of the Dominion Geological staff, are at present camping infront of French Village, Kingsclear, and are daily surveying in that locality."

Fredericton Capital - May 12, 1881 Geological Survey.- Mr. Wallace Broad, of the Dominion Geological Surveying Department whose headquarters is at Montreal, was at the Barker this morning. He left for the Nashwaak to-day, accompanied by Mr. Wm. McInnes, with a view to commencing operations there. In about three weeks Mr. Broad intends having a camp made, for convenience sake, in the vicinity of his expeditions, at the conclusion of which maps will be made of the localities that have been inspected."

S.J. Daily Telegraph - Sep. 5, 1881 Prof. L.W. Bailey and Mr. W.F. Best have just returned from a geological excursion in the northern part of York county."

Fredericton Capital - Sep. 15, 1881 The Geological Survey of Canada.- The Geological and Natural History Survey of the Dominion is a most important and necessary institution, having for its object the ascertaining of the mineral and agricultural resources of the country, as well as furnishing an accurate knowledge of its flora and fauna. The survey was established in Montreal by the late Sir William Logan, about the year 1833, and continued under his direction till 1869, when Mr. Selwyn, formerly of the Geological Survey of Victoria, Australia, became Director. Previous to 1833 very little was knownof the geology of Upper Canada, but owing to the unwearying efforts of Sir William and his able assistants, Dr. Hunt and Mr. Billings, the geological structure of Ontario and Quebec was carefully worked out, and the mineralogy and palaeontology accurately determined. In addition to the annual Reports of Progress, these gentlemen published in 1863 the Geology of Canada, a comprehensive summary of their geological explorations and investigations up to that time. Since 1866, owing to the increased extent of territory consequent upon the union of the Provinces, the staff of the survey has been added to till it now numbers about twenty-five field and office hands, and the annual grant has been increased to $50,000. This amount is not large, considering that it defrays all the expenses of exploration as well as pays all the salaries. Our own Province has received considerable attention from the Geological Survey. In the annual Report of Progress for 1870-71, Prof. Bailey and Mr. G.F. Matthew published a summary of their joint labors in New Brunswick up to that date, and since then these gentlemen have been employed in field work by the department during a portion of each summer, up to the year 1879; and their valuable reports on the geological structure of the Province have been published in the annual Reports of Progress of the Survey. It is to be regretted that the department has not sufficient funds to retain the services of these efficient scientific gentlemen. Since 1873, except during the summer of 1874, which he spent in the North-West Territory, Mr. R.W. Ells has also been employed in this Province, part of the time working conjointly with Bailey and Matthew, and the rest of the time doing independent work. The department have it in contemplation to construct a complete geological and topographical map of the Province of New Brunswick, on a scale of one inch to four miles. In order to do this more conveniently, and to give the work to the public as soon as possible, the map is to be issued in sections, three of which were published the past spring. The maps recently published illustrate the work of Messrs. Bailey, Matthew, and Ells, and were compiled and drawn by R.W. Ells and Wallace Broad. They are beautifully printed in colors and have convenient marginal references and notes. The region thus mapped embraces the counties of Charlotte, St.John, King's, Albert, and portions of Queen's, Sunbury, and Westmorland. Mr. Ells has been engaged for the past three years in surveying the northern and eastern counties, and probably next year he will have ready for publication three additional sections of the Provincial map, embracing the greater portion of the counties of Restigouche, Gloucester, Northumberland, and Kent. Mr. Broad has been engaged in York and Carleton Counties for the past three summers, and has been carefully working out the geology, as well as making accurate topographical surveys, of the region. He expects to be able next spring to publish still another section of the Provincial map, embracing the remaining portions of Queen's and Sunbury counties, the greater part of York county, and Carleton county as far north as the latitude of Woodstock. This brief review of work of the Dominion Geological Survey, and the work that is being done by it in New Brunswick, seems necessary in view of the little that is generally known of the existence of the department, and the nature and importance of its work. An investigation of the agricultural and mineral resources of the country is of the first importance, and the result of such investigation can only be made intelligible by means of accurately constructed maps. If we may judge of the thoroughness of the work in New Brunswick by the maps recently published, we have no hesitation in saying that it is being most carefully and thoroughly done, and the map when completed, will be a most accurate guide in the selection of farming lands and in the development of mineral deposits."

Moncton Daily Times - Apr. 25, 1882 The Flats of quicksand in the Petitcodiac River are continually changing. When yesterday's tide was outthere was only the slightest sign of a channel on this side of the river, the principal flow appearing to be on the Coverdale side."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Daily Sun - Feb. 7, 1882 Our Mines and Forests. - ... As regards our mining interests, as we formerly pointed out, the laws and regulations relating to them are in a sad state, and the services and opinions of a competent person as to the remodelling of them upon some fixed and certain basis,are absolutely necessary, since it is impossible to expect that lawyers, farmers or business men in the Government have the requisite knowledge of the mining business to attempt this. In view of the great number of mining enterprises which are being started among us, some of which, to say the least, are of a very questionable character - being like Peter Pindar's razors, started only for the purposes for sale - some go so far as to urge that each mining company should be required before offering its stock in the market to have its property inspected and reported upon by the Government Inspector of Mines. Without endorsing so bold a proposition we are free to say that had such an appointment been made, we know of more than one instance where much money would have been saved to the public. An inspector of mines could also collect all the facts about the occurrence of mineral veins, beds, or

deposits in the Province, and the same might be published, as has been done by the Inspector of Mines in Nova Scotia. There is very little reliable information to be had now about our mines and minerals, and this little is embodied in the report of the Geological Survey of Canada, among a mass of other facts and speculations through which a practical business man would hardly care to wade. We have besides the above couple of reports by Professor Bailey, and one by Professor Hind, together with the old Gesner reports, now out of print. We freely acknowledge the great benefit which the Geological Survey of Canada has carried on the Dominion, but a geological survey is not a mineralogical one. It is certainly the duty of the Government to have all the facts relative to our mineral wealth collected and published in pamphlet form - not a very expensive matter - so that the public would know where to place their hands upon information so desirable."

St. Croix Courier - Feb. 16, 1882 A petition to the Director of the Geological Survey of Canada is being circulated through town praying that a detailed geological examination of the so-called Silurian belt in northern and western Charlotte be made. It is thought that a survey of this kind will result in the development of valuable mineral deposits."

Fredericton Capital - Jun. 1, 1882 Geological Survey.- Wallace Broad, Esq., of the Dominion Geological Survey, accompanied by Robert Chalmers, Esq., of St. John, left this morning for Woodstock, where his operations will be

N.B. Reporter - Jun. 3, 1882 and Daily Telegraph - Jun. 5, 1882 Dominion Geological Survey. - Messrs. Wallace Broad, of St. Stephen, Robert Chalmers, of St. John, and Wm. McInnes, of this city, started for Carleton County this week and will confine their survey the present summer to the many points of interest in that county. Messrs. Broad and McInnes have furnished the Dominion Government with the results of their extended geological survey in York County."

N.B. Reporter - May 31, 1882 Prof. Bailey, of the University N.B., read a very interesting paper on the Physical and Geological features of the St. John Valley before the Royal Society in Ottawa on Thursday evening last."

S.J. Daily Sun - Apr. 3, 1883 Geological Survey office on S.J. water supply....."

S.J. Daily News - Aug. 10, 1883 A geological and Submarine survey of Passamaquoddy Bay is being made by a large

S.J. Globe - Aug. 13, 1883 Woodstock, Aug. 11. - Geological Survey. - Professor L.W. Bailey, of the Fredericton University, and Robert Chalmers, Esq., are in this county now engaged in the Geological Survey. The districts gone over are examined very carefully and the results of the observations are published in the general report issued at Ottawa."
Moncton Daily Times - Feb. 23, 1883 Present of Minerals to Moncton High School. - As noted in yesterday's Times, Dr. Geo. H. Dunlap has just presented to the Moncton High School, for the purpose of stimulating scientific study, a valuable collection of minerals, including the following: Native sulphur from Vesuvius, sulphate of baryta, agates (three varieties), from Thunder Bay; selenite, garnets from Newfoundland; tourmaline, iron pyrites, magnetic iron, heulandite, clay iron stone, quartz, native copper, asbestos, copper pyrites, serpentine, calcite, talc, grey antimony, albertite, bituminous shale, micaceous clay, jasper, bronzite, variety of pyroxene, crystallized gypsum, metallic antimony, ironpyrites, albite, garnets, 3 varieties galena, malachite, quartz crystals in agate, potstone, fossil ferns, micaceous iron ore, chlorite, (2 specimens), rose quartz, graphite, fluorspar, black mica, anthracite, milky quartz, amethysts, satin spar, and specular iron ore. Persons desirous of adding to the above collection can be accommodated."

Daily Telegraph - Jan. 29, 1883 Geology is, no doubt, a very interesting pursuit, but we are pleased to notice that Mr. Robert Chalmers has not been so absorbed in it as to leave him no time toattend to social matters. Probably he has found a helper in his scientific studies. At any rate Mr. and Mrs. Robert Chalmers are now in town, as their friends will gladly learn, in order to tender them their congratulations."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Daily Sun - Jul. 4, 1883 and N.B. Reporter - Jul. 7, 1883 and Weekly Transcript - Jul. 11, 1883 The Geological Survey. - Mr. Wallace Broad, we understand, has retired from the Geological Survey and the work will be carried on in New Brunswick this season under the direction of Professor Bailey, of Fredericton.He will be assisted by Messrs. Robt. Chalmers and Wm. McInnes, and his son, Master J.W. Bailey. The survey will be confined mainly to the Valley of the St. John and adjacent territory, namely, to the Counties of York, Carleton, Victoria and Madawaska, and will embrace the collection of data for completing the geological map of the Province and writing a report on the geology of the above mentioned district. Mr. Robt. Chalmers will devote special attention to the surface geology of the region and a special report on that subject will be prepared by him. He and Prof. Bailey's son left Vanceboro together on Tuesday last, on a canoe trip of a few weeks to explore the Cheputnecticook Lakes and vicinity and collect information which may serve to throw light on the peculiar formation of the lake-basins and sand and gravel deposits in southern and western New
Fredericton Capital - Jul. 10, 1883 and S.J. Daily News - Jul. 11, 1883 Geological Survey.- Dr. Bailey, of the University, and Wm. McInnis, Esq., of the Geological Department, Ottawa, left this morning on the N.B. Railway to commence their summer labors in Carleton County. They will be joined in a few days by Mr. Chalmers and Master Joseph Bailey, who are now on the Charlotte Border lakes."

S.J. Globe - Jul. 31, 1883 Centennial Exhibition Commission. - The Mines and Minerals Committee recommended some additional prizes in this class. The report was adopted and ordered to be appended to the prize list."

N.B. Reporter - Jun. 13, 1883 It is said Prof. Bailey will resume his geological survey in York and Carleton Counties next month. He will be assisted by Mr. William McInnes, now of Ottawa, and other gentlemen."

Fredericton Capital - Jun. 19, 1883 Prof. W.L. Goodwin, of Sackville, has been appointed to the Chair of Chemistry and Mineralogy of Queen's University, Kingston. This is the second of its strong men that Sackville has had captured during the past year by richer colleges. In the same way Acadia,last year, lost Prof. Schurman, and our own University was compelled to give up Prof. Fletcher. The appointment of another Gilchrist scholarship man to Sackville, in Prof. Hutton, shows what an influence for good in developing and bringing forward our own men this scholastic prize has had..."

S.J. Daily Sun - Jun. 20, 1883 Dr. Goodwin of Sackville. - prof. of mineralogy at Queens...."

S.J. Globe - May 24, 1883 Exhibition. - At the meeting of the Executive committee yesterday . The following committee on mines and minerals was appointed:- G.F. Matthew, Alfred Markham, John Byers, W.F. Best, R.P. Starr and J.E. Gilpin, with power to add to their number."

Fredericton Capital - May 31, 1883 Professor Bailey will take charge of the geological survey in this section of the province during the coming summer. He will have associated with him Mr. William McInnis and Mr. Chambers, both of whom are now permanently attached to the staff of the survey. The field of their operations will be in the upper part of York County and in Carleton County."

S.J. Globe - Oct. 1, 1883 Exhibition. - .... Old Building. - On the main floor of this building the first object that one encounters on entering is a huge monument of red granite, backed with an exhibit of coal, while on the opposite side of the entrance stands a table covered with minerals of different kinds. ......"

S.J. Daily Sun - Oct. 2, 1883 Natural History Department. - Exhibition. - ...... The minerals and ores represent very fairly what this Province and Nova Scotia can produce, although many specimens entered have not yet come to hand. It is to beregretted also that many of the minerals and ores have not been arranged more systematically, the better to represent our mineral wealth from different sections of the Province. Where this has been done the display is a most instructive one and in the case where the minerals are not shown to best advantage it is not yet too late to make a more systematic

S.J. Daily Sun - Oct. 4, 1883 Exhibition. - Notes. - ....The display of useful minerals by W. F. Best, Esq., in the Natural History Society's room, was placed on exhibition yesterday and attracted much attention on account of the excellent arrangement made for showing them to advantage."

Fredericton Capital - Oct. 27, 1883 Mr. Edward Jack's Explorations and Discoveries in the Wilds of Central New Brunswick. - ... to the Southwest Miramichi by way of Maple Grove ... above Burnt Hill ... Mr. Jack stated that this whole district - on the head of the Tobique, Little S. West, Dungarvon and Rocky Brooks - is one vast granite formation, instead of merely having granite in belts, as is usually laid down in the geological maps. The surface of the land is largely composed of granitic rocks, but without large boulders. ..."

Daily Telegraph - Apr. 4, 1884 The Geological Survey. - The Minister of the Interior reports as follows: in New Brunswick the work has been continued, during the past season, under the supervision of Prof. Bailey. His own work in the fieldextended from the 1st of July to the 1st of October, and that of his assistants, Messrs. McInnes and Chalmers, form the same date to the 31st of October. The attention of Prof. Bailey and Mr. McInnes was directed chiefly to observations required for the « sheet map, No. 1, N.W., embracing portions of the counties of York and Carleton, commenced in 1879 by Prof. Bailey and Mr. Broad, and further advanced by the latter in 1880 and 1881. This map is now ready for the engraver. It covers an area of about 4,650 square miles, coterminous with that embraced in the « sheets already published. The details of the season's work will be given in the report now being prepared, including that of Mr. Robert Chalmers, whose attention was directed to the surface geology and physical features of the region embracing the valley of the St. John river, from Fredericton to Edmundston, in the county of Madawaska; also the valley of the Becaguimec, Shiktehawk, Tobique and other eastern tributaries of the St. John, and westward from the latter to the Maine frontier. Mr. Chalmers paid particular attention to the nature of the soils in the districts examined in relation to their forest growth and suitability for settlement. The cost of the season's explorations was $1,894.96, including salaries of Prof. Bailey and Mr. Chalmers."
Fredericton Capital - Apr. 5, 1884 The Geological Survey. - From the report of the Minister of the Interior, the cost of the last summer's explorations of the Dominion Geological Survey including the salaries of Prof. Bailey and Messrs. McInnes and Chalmers, was $1,394.96."

S.J. Daily Sun - Feb. 2, 1884 Edward Jack, C.E., and Prof. Bailey, of the N.B. University are jointly preparing a geological description of New Brunswick, for Mr. Jack's use at the World's Forestry Exhibition at Edinburgh."

S.J. Globe - Feb. 6, 1884 S.J. exports to Jan. 31: 1883 1884 Produce of the mine ... $150 80"

St. Croix Courier - Feb. 7, 1884 The SUN says that Edward Jack, C.E., and Prof. Bailey, of the N.B. University, are jointly preparing a geological description of New Brunswick, for Mr. Jack's use at the World's Forestry Exhibition at

Codes: GEOL / IDX_Names: Geology - General;
Daily Sun - May 10, 1884 Origin of the Grand Falls of the St. John by R. Chalmers. (Read before the Natural History Society of N.B., May 6, 1884). - Mr. President and Members of the Natural History Society: - A number of you have, no doubt, visited Grand Falls and know as much about the grandeur of the scenery and the general appearance of the cataract and gorge as I do; but for the benefit of those of you who may not have been there, I shall preface my observations with a short description of these interesting and remarkable phenomena the most imposing certainly in the Maritime Provinces - which are of late years, since railway facilities have been provided, attracting tourists and pleasure seekers, as well as lovers of nature to see them every summer. The Grand Falls are situated about 200 miles from the mouth of the St. John. This majestic river, after sweeping along a course of more than 150 miles through Northern Maine, approaches New Brunswick at the extreme northwestern corner, and for the next 75 miles runs in a southeasterly direction through the fertile and beautiful Madawaska Valley. In the last 40 miles of its course before reaching Grand Falls its flow is comparatively tranquil. At the falls, however, it expands into a lake- like basin, known as the Upper Basin, which extends longitudinally east and west for 300 to 400 hundred yards; then suddenly making a detour to the southeast, it precipitates its massive current into a narrow, yawning, rock-bound chasm about 200 feet wide and 100 to 150 feet deep in a torrent of foam and spray. Dr. Abraham Gesner, who visited these falls and wrote about them 40 years ago, gives a graphic description of them in one of his reports, which I cannot do better than quote. He says:- From a peculiar notch in the rock the water descends into the gorge from the front and on each side and falls over a perpendicular cliff of calcareous slate. In the mist that ascends from the bottom of the gorge there is an ever varying rainbow arching the roaring vortex, and jets of white spray sport over the troubled pool. On the brink of the fall the water descends six feet and it runs so smoothly that its surface appears to be oiled. With these there is a deafening noise of a falling river which many imagine, but few can describe. The gorge is three quarters of a mile long and is bound by perpendicular overhanging cliffs from 80 to 150 feet high. It is a narrow and frightful chasm, lashed by the troubled waters and excavated by the boiling eddies and whirlpools always in revolution. The course of the gorge is semi-circular curving to the S. and W.; at last the water plunges into a basin below in an immense frothy sheet, and the river resumes its original features. The perpendicular height of the cataract is stated to be 74 feet, (some measurements make it 78 feet) and the river descends from the upper to the lower basin 118 feet. It is a curious and interesting sight to witness the descent of a quantity of timber or logs over the Falls. Dr. Gesner thus describes the passage of a number of logs as it came under his notice:- Pieces of pine 60 feet in length, he says, sometimes shot up into the air endwise and nearly their whole length, and large trees were frequently broken. The projecting rocks along the sides of the gorge produce eddies, into which the timber is often drawn and made to revolve against the rocks until it is much injured or ground to pieces. A very good view of the cataract and gorge may be obtained from the Suspension Bridge which spans the river a short distance below the Falls; but in order to get the full effect of the grandeur and beauty of the whole it is necessary to descend into the gorge. Stairways have lately been erected at several points, so that this feat can now be accomplished with comparatively little difficulty. The potholes, some of which are from 10 to 15 feet in diameter, are objects of great curiosity, and are perhaps the most wonderful of all the phenomena connected with the falls. They have been formed by the continual whirling motion of one or more stones by the eddies which occur at or near the foot of the perpendicular fall as it eroded and opened up the gorge from time to time backward from the lower basin. The scene in the bottom of the gorge is grand and impressive. Standing on some jutting rock and gazing at the mighty rush of the falling waters, at the foaming torrent sweeping by, on the frowning precipices on either side sculptured by the roaring floods and the masses of ice and drift which have been poured through this channel for long ages, a feeling of awe creeps over the beholder at the immensity of power here exhibited, and he is ready to exclaim, truly, how feeble and insignificant is man amid the wild forces of nature! But feelings of wonder after a time give place to other thoughts, and one of the first inquiries which will suggest itself to the student of nature is, how were this ever-rolling cataract and this vast rock-sculpturing produced? What causes, or combination of causes, brought about these grand phenomena? to answer this question is the chief object of my paper this evening. And first, it will be necessary for me to take my hearers back in imagination over an immense period of time when the St. John had no Grand Falls, at least none where they now exist. The great age of the St. John river is a fact now admitted by geologists, and I believe has already been brought to your notice in a lecture delivered by Prof. L.W. Bailey, not long ago, before this Society. It was then shown, if I mistake not, that the noble river which flows past our city must have had its beginning far back in the dim ages of the past, long ere this fair land of Acadia had assumed its present form and while yet large areas of what are now dry lands were covered by the sea. Evidence has been obtained, I believe, in York Co., tending to show that a river valley coinciding with that of the St. John, existed there early in the carboniferous age. Whether it continued open during all succeeding time or not it is difficult to say, although we may reasonably suppose that it did, for the area drained by the Upper St. John has probably not been beneath the sea since the close of the epoch mentioned, no rocks of later date

having been met with yet in Western New Brunswick or Northern Maine. Existing in those remote ages, then, it has probably continued to form the main artery for the draining of that section of country during all the time that the materials of the permo-carboniferous and triassic rocks in Acadia were accumulating, and while those of the jurassic, cretaceous and tertiary, of which we have no record here, were being laid down in other parts of the world, as well as during the later quarternary period. But whether it had a continued existence throughout these ages or not we have abundant evidence that at the close of the tertiary, that is in the pliocene period, the St. John flowed in nearly the same course as at present, a large river, receiving tributaries on either hand, and eroding a channel wide and deep. No Grand Falls then existed where they now are; but, on the contrary, the river channel at that time, so far as it can be traced at the present day, at what are called the upper and lower basins, near the falls and in other places along the river's course, appears to have been considerably deeper than that which now obtains, but how much deeper it is impossible to say without the aid of borings or excavations. Towards the close of the last mentioned period (the pliocene) a great change took place in the climatic conditions of the country, and the glacial or ice age was introduced, in which the whole of Northeastern America, at least, was locked up in perennial snow and ice, with the temperature probably as low as that prevailing in Labrador and Greenland at the present day. Whether the whole surface of our Province was then above sea level and mantled with a sheet of ice such as now covers Greenland, or whether it was submerged beneath the sea so that ice-laden currents passed over it, are questions which I shall not now discuss. Suffice it to say, that during the period referred to or towards its close, the debris which was lying on the surface of the rocks everywhere at the close of the pliocene and previous to the accumulation of the ice upon it, as the result of atmospheric or subaerial disintegration, and which was undoubtedly many feet in depth, was shifted about by the moving ice, causing the rocks to be scored underneath, and, in many cases, choking up the river valleys, and other depressions. Considerable portions of this material, which is usually called drift, were thrown into the valley of the St. John, apparently filling it up in places nearly to the general level of the country on both sides. The waters of the river thus dammed up would, on the retreat of the ice, be let loose and form, in all probability, a chain of lakes along the valley, and would tend to flow at a level of 100 to 200 feet above the present stream bed. A re-excavation of the drift occupying the valley would erode and clear out its preglacial channel, but in some places, from local obstructions and other causes, in many instances now impossible to determine, the current would be to one side or the other, and the excavation of a new channel in the solid rock would be the result. In this manner have the Grand Falls of the St. John originated. At the period referred to, i.e., the Ice Age, a mass of drift was thrown into the old pre-glacial valley of the river here, filling it to a height of 200 to 225 feet above the level of the lower basin. An attempt seems to have been made by the current to keep open the channel or remove this material, for we find a passage 60 to 70 feet deep in the drift extending along the course of the pre-glacial, one from the upper to the lower basin, but this minor channel seems also to have become choked up, for we find it nearly closed at both ends, and the whole force of the current would then, consequently be thrown to the eastward in the direction of the present channel. Along this channel, about a quarter of a mile from the old drift-filled one, the St. John was joined by Little River, a stream now emptying into it just at the falls. And it is probable that the direction which the main river took from their confluence to the lower basin was originally determined, in part at least, by the Little River channel and partly also, perhaps, by a small stream emptying into it lower down called Falls Brook; but in any case the Falls, or cataract, would first be at the lower end of what is now the gorge, and as erosion advanced and opened it up backward, would recede from time to time till they reached their present position and dimensions. How long it has taken the waters to excavate the gorge we have at present no means of computing in years; but, judging from the slow rate at which erosion is now going on, scarcely any perceptible change in the aspect of the Falls occurring in the course of a life time, so far as I can ascertain, the period must be enormous. And yet this period represents only the latest, and to all appearance the shortest, of the divisions of geological time. Many changes have taken place in the St. John valley since the Grand Falls were first formed. The drift beds have been deeply eroded and the materials carried down to a lower level by the river and remodelled, forming terraces and alluvial meadows which skirt its waters throughout nearly its whole course. And the St. John apparently flows along its valley at a level of 150 to 200 feet lower than it did at the close of the ice age, except at Grand Falls and some short distance above it, as has been shown, where the pre-glacial channel has not been cleared out. The fact of the river flowing at such a high level in early post-glacial times is inferred from the presence of stratified sands and gravel found on the sides of the valley, deposited there evidently by currents at a former period, as well as from the occurrence of the drift dams referred to at Grand Falls and elsewhere. In the gorge now being opened up as a new channel at Grand Falls, the process of degradation, although almost imperceptible, still goes unremittingly on; and its extension backward to the upper basin and the destruction or obliteration of the Falls are events which, geologically considered, are of no remote date in the future. Not in our day, nor for many hundreds nor perhaps thousands of years to come will these things happen; but they are none the less certain. As soon as the river has worn the rock backward to the upper basin, or old pre-glacial channel, the Falls will be destroyed. Erosion of the drift occupying the old channel above that will then begin, and we will have a rapid, or series of rapids, through the gorge, instead of a cataract. A striking and remarkable illustration of the completion of the similar work of excavating a new channel is exhibited at the Narrows on the Tobique River near its mouth. The falls once existing there, of which we have proofs in the deep excavations of the gorge, and the presence of numerous potholes along its sides are now gone, and there remains but a series of rapids instead. The ancient pre-glacial channel can be traced to the right between the upper and lower basins which also occur here, a hill intervening between it and the gorge. To sum up, the Grand Falls of the St. John then have been caused by a diversion of the river from its pre-glacial channel, this channel having been blocked up with drift in this part of its course during the ice age. The drift dam must have raised the river to the height of the uppermost terraces, 200 to 225 feet above the level of the lower basin, and probably held in a lake or lake- like expansion above the falls, and the overflow, or outlet then appears to have formed a new channel to the left of the old one, in the direction of Little River, and commenced the process of rock excavation. This semi- circular course of the river and gorge between the upper and lower basins may have been determined, partially at least by Little River, as the lower part of the gorge is seen to follow what was probably the course of that stream had it existed previous to the time that the St. John began the erosion of a new channel here. But the principal work of eroding the gorge has been almost wholly accomplished since the ice age, by the slow and unremitting wear caused by the falling waters of the St. John. The foregoing explanation in reference to the origin of Grand Falls seems applicable, so far as my observations have extended to all waterfalls in New Brunswick. The Aroostook Falls, a series of cascades extending along that river for a mile and a half through which it descends about 75 feet, have been caused by a similar damming of the pre-glacial channel and diversion of the stream. The New Brunswick Railway here runs along the old drift-filled channel, which is to the right of the present one. Grand Falls on the Nepisiguit River, and a number of smaller ones in different parts of the Province, can be accounted for in a similar manner. Indeed, in all countries in the Northern Hemisphere which have been glaciated during the ice age, wherever river valleys ante-dating that epoch existed and were choked up with drift, there have been diversions of the streams from their original beds and in many cases a cutting of new channels through the solid rock, producing sometimes water falls; but oftener, as seems to have occurred at the Tobique Narrows, showing the work of excavation by such falls completed. W.M. Davis refers to phenomena of this kind as occurring in Pennsylvania, in a paper in Science, vol. 1, no. 11, page 304, and other geologists, notably Prof. James Geikie in a work entitled The Great Ice Age, explains the origin of certain precipitous rock- bound portions of river channels in the British Islands in the same way also, that is, by supposing there to be new channels formed by the post-glacial erosion of the rivers. Tyndall's reflections in reference to erosion in the valleys of the Alps are not inappropriate to the Grand Falls of the St. John, when viewed with the eye of the geologist: There is a grandeur, he says, in the secular integration of small effects implied by the theory of erosion almost superior to that involved in the idea of a cataclysm. Think of the ages which must have been consumed in the execution of this colossal sculpture. The question may, of course, be pushed to further limits. Think of the ages which the molten earth required for its consolidation. But these vaster epochs lack sublimity through our inability to grasp them. They bewilder us, but they fail to make a solemn impression. In

Daily Telegraph - Oct. 22, 1884 New Brunswick Minerals for the Exposition at New Orleans. - To the Editor of the Telegraph:- Sir: In accordance with the request of Mr. Paul Large, American consul at St. Stephen, I have undertaken to prepare a cabinet of New Brunswick minerals, to be exhibited at the world's industrial and cotton centennial exposition to be held at New Orleans during the coming winter. In this work I would ask your co-operation. As regards the great desirability of having our very considerable but comparatively little developed mineral wealth represented abroad, I need say nothing. I know that the press of the province will appreciate its advantages, and I would ask you to assist it through your columns. I assure you that I have no other motive in undertaking the work except the hope that it may be for the advantage of this province. It involves considerable expense for cases, transportation, etc., all of which will be borne by Mr. J.H. Ganong, of St. Stephen. Now in preparing such a cabinet it should be made complete and thoroughly representative. From my own collection I can supply most of the specimens, but many of the latter are not truly representative. I would therefore ask you to mention in your columns the fact that such a cabinet is being prepared, at the same time stating the advantages to be derived from such a representation of our minerals abroad. I would also ask you to request the co-operation of directors of mining properties, and others likely to be interested in the work, asking them to send good representative specimens of their ores to me for this province. Especially might be mentioned specimens of the various building stones, granite, freestone, etc., together with limestones and gypsum. Ores of all kinds are, of course, included - coal, bituminous shales, rock suitable for grindstones, whetstones, etc., asbestos, and in fact minerals of any description whatsoever which are of economic value, directly or indirectly. Specimens should be of not too large size, and should be accompanied by the name of the sender. Each specimen in the cabinet will be labelled with the locality, name of the company or individual owning the property upon which it occurs, together with other important information, such as the capital invested (if the mine is worked), the value of the annual output of ore, analyses of the latter, etc., all of which information should accompany any specimens sent. As all must be completed within three weeks and despatched to New Orleans, I would particularly ask that any correspondence upon the subject should be entered into, and that any specimens which the owners will be good enough to collect and send to me, should be sent as soon as possible. I would ask you to publish the substance of the latter part of this letter, if you think it desirable to do so, and in conclusion would again ask you to assist what, I am sure, is for the advantage (even if it not be very great) of this province. Yours Truly, W.F. Ganong. St. Stephen, Oct. 21."

S.J. Daily Sun - Sep. 3, 1884 Natural History Society. - ... Accessions .... from J.W. Wilson ... a calamite and specimens of coal..... block of Carboniferous, full of fossiliferous shells, by W.H. Whiting; specimens of sandstone with concentric color bands, by John McGourty; and for the library Report of Committee on Geological Survey, from C.W. Weldon, M.P., ... Matthew....."

Daily Transcript - Sep. 10, 1884 Sir William Dawson. - Sir John William Dawson, LL.D., F.R.S., F.G.S., C.M.G., K.B., was born at Pictou, Nova Scotia, in October, 1820. He studied at the University of Edinburgh, and returning home he devoted himself to the natural history and geology of Nova Scotia and New Brunswick. The result of these investigations are embodied in his Acadian Geology (3rd Ed. 1880). In 1842, and again in 1852, he accompanied Sir Charles Lyell in his explorations in Nova Scotia, aiding him materially in his investigations. Ever since 1843 he has contributed largely to the

Proceedings of the London Geological Society, and to scientific periodicals. He has also published numerous monographs on special subjects connected with geology. His two volumes on the Devonian and Carboniferous Flora of Eastern North America, published by the Geological Survey of Canada, and illustrated from drawings by his daughter, are the most important contributions yet made to the paleozoic botany of North America; and he is the discoverer of the Eozoan Canadense, of the Laurentian limestones, the oldest known form of animal life. In 1850 he was appointed Superintendent of Education for Nova Scotia, in 1855 he became Principal of McGill University of this city, of which he is now Vice-Chancellor. He is a member of many learned societies in Europe and North America. Among his works not already mentioned, are: Archata, or Studies on the Cosmogeny and Natural History of the Hebrew Scriptures, 1858, and The story of the Earth and Man, 1872, in which he combats the Darwinian theory of the origin of species. In 1875 he published The Dawn of Life, - an account of the oldest known fossil remains, and of their relations to geological time, and the development of the animal kingdom; in 1879 appeared The Origin of the World, and in the following year Fossil Men and their Modern Representatives. In 1880 appeared The Change of Life in Geological Times, - a sketch of the origin and succession of animals and plants. He has also contributed largely to the Canadian Naturalist, and to many educational, scientific and religious publications in Great Britain, the United States and Canada. In 1881 Dr. Dawson was created a Companion of the Order of St. Michael and St. George; in the following year was selected by the Marquis of Lorne, our then Governor-General, to take the Presidency of the Royal Society of Canada, an institution founded to and the development of literary and scientific researches in our Dominion; and he has just had conferred on him the dignity of Knight Bachelor. - Witness."

Daily Telegraph - Apr. 22, 1885 Natural Society Bulletin - Mr. W.L.T. Reed contributed a short paper on the surface Geology in the vicinity of Fredericton, where certain deposits occur which indicate the former existence of an extensive lake in the interior of the province in comparatively recent times."

S.J. Daily Sun - Jul. 11, 1885 A copy of the Geological Survey of Canada for 1882, 83, 84, with the accompanying maps, has been received by Portland Public Library from H. Wilmot of Fredericton. The directors acknowledge the donation with S.J. Daily Sun - Jun. 2, 1885 Royal Society of Canada - … Annual meeting ….Illustrations of the Fauna of the St. John Group No.3 by G.F. Matthew Notes on the Economic Minerals of New Brunswick, with a revised list of mineral localities in the province. By Prof. L.W. Bailey."

Daily Telegraph - Oct. 17, 1885 Geological Excursion. - On Saturday last the senior class of the New Brunswick University, accompanied by Dr. Bailey, went up to Rockland on the N.B. railway on a geological excursion. They had a very pleasant and profitable trip. The young gentleman under the almost unlimited knowledge of their professor in that subject gained much information in the general plan of geology which they are just entering, in their course of studies. They returned in the evening with the train from Woodstock. As they were parting with the doctor, after their return, the senior class endeavored to show their high appreciation for his voluntary labor and kindness to them during the day by proposing three cheers and a tiger for Dr. Bailey, in which all joined very heartily.- [Gleaner."

Daily Telegraph - Sep. 18, 1885 Dr. Bailey, of the University, and his son, Joseph Bailey, returned to Fredericton Wednesday evening from the upper waters of the St. John, of which region they have been making a geological survey for the past few weeks."

Daily Telegraph - Jan. 14, 1886 The Colonial Exhibition. - To the Editor of the Telegraph:- …As our exhibit at the Antwerp exhibition was exceedingly small and many did not send who had promised, I trust we will make a better show at London. The articles sent from New Brunswick to Antwerp consisted of crude gypsum, specimens of manufactured plaster of paris and ground plaster, manganese ore, collection of woods ... send their applications at once to Mr. Best ... Yours truly, Ira Cornwall, jr."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Globe - Jun. 15, 1886 The Kames and Terranes of New Brunswick. - by R. Chalmers, Geological Surveyor. - The geologist or student of nature will find wherever he goes in New Brunswick phenomena of more than ordinary interest to excite his curiosity and prove incentives to study. If he has an eye to the picturesque he will meet with views of natural scenery on every hand, by hill and shore, by woods and waters, which, although not always grand, are yet impressive and varied. should he ascend our noble rivers and penetrate the interior, the rugged mountains and deep valleys there will afford him glimpses of the primeval architecture of the country, and suggest the powerful agencies which have been at work sculpturing and carving out its massive features; while the pleasurable activities of mind and body called forth in traversing untrodden routes, in scaling mountain heights and viewing the landscape from lofty peaks will more than compensate for any hardships undergone. From the summit of the Blue Sagamook Mountains, or the peak of Tenerife, near Nepisiguit Lakes, each of which affords a magnificent prospect of hill and valley and distant forest-clad range, with quiet lake gleaming below, or river meandering by, he will feel a higher and purer current of life flowing through his veins

and will return from their precipices a wiser as well as a stronger man. And even where the scenery is less bold and imposing there are always sufficient diversity and charm in rounded hill or smiling valley, in woodland or lake, to lend enchantment to the view, and induce the passing beholder to linger over it. Perhaps, in few places in Eastern Canada are so many pleasing scenes to be met with as in the valley of the St. John, whose gently undulating contours, unique terraced slopes, and fertile intervales and islands, are alike objects of interest to the geologist and tourist. Among the many natural features and curiosities calculated to attract special attention and inculcate a desire for knowledge, as regards the works of nature around us, those which form the subject of this essay are, perhaps, not the least inviting. Along our principal river valleys, bordering our lakes, and in many places on the coasts, gently-rounded ridge, or grass-covered terrace, rising in successive steps, will at once arrest the eye, and set the enquiring mind meditating as to their genesis and history. The formations discussed in this paper are among phenomena which are the result of the great forces of erosion that have been in operation during the post tertiary period, being some of the residual forms of the grand process of moulding and carving out hills and valleys through the influence of atmospheric and marine agencies. The energy of nature is unceasing. Air, frost, rain, rivers, glaciers and the sea are her tools, each of which has been at work on the fair face of our country for long ages. As a well known and eminent geologist, Prof. Archibald Geikie, says: With these implements, out of the huge bulk of the land, she cuts the valleys and ravines, scoops the lake basins, hews with bold hand the colossal outlines of the mountains, carves out peak and crag, crest and cliff, chisels the courses of the torrents, splinters the sides of the precipices, spreads out the alluvium of the rivers and piles up the moraines of the glaciers. Patiently and unceasingly has this great earth sculptor sat at her task since the land first rose above the sea, and there she will remain at work as long as mountains stand, and rain falls, and rivers flow. The phenomena of the kames and terraces which I propose to discuss very briefly are, it may be remarked, neither new nor phenomena. Most persons who have travelled over the southern and western counties of New Brunswick must have observed the kames, with their greatly swelling outlines, or long, often tortuous, ridge-like forms, presenting conspicuous features in the landscape; while in river valleys, terraces, rising step by step like gigantic stairways, frequently carpeted with a rich green award in spring and summer, and shaped with a beauty and symmetry which would require the pencil of the artist to justly portray. These will cause the geologist or lover of nature to pause and contemplate their unique forms and structure. Kames are low ridges, from one or two hundred yards to several miles in length, composed of gravel and sand intermixed with rounded stones (boulders) and occur at all elevations from sea level to the summits of the highest water-sheds in the province. A large and characteristic one may be seen stretching 7 or 8 miles along the upper part of Eel River, York County. Another fine kame was observed near Pocawagamis Lake, a third at the head waters of the Mactaquac, and many more occur in the lake region and along river valleys in western New Brunswick. In the St. John valley two or three well formed kames have been noticed between Canterbury and Woodstock and others in different places as far up as Grand Falls. Along the valleys of the Magaguadavic, Digdeguash, etc., formations of this kind are likewise frequently met with. Near the coast of the Bay of Fundy we find a large wide kame at Pennfield, called Pennfield Ridge, another at Lake Utopia and several in the vicinity of St. John. The latter have been described by Mr. Matthew in the Report of Progress, Geological Survey of Canada, 1876-77, and elsewhere. Kames are found in other parts of Canada and in the northern United States, and, indeed, in all countries which have been glaciated during the Ice age. In the British Islands and Scandinavian peninsula, where they are largely developed, they have been assiduously studied for the last quarter of a century and various theories advanced to explain their origin. The two most generally accepted of these are (1) the marine theory, which supposes them to have been formed by oceanic currents during the quaternary subsidence of the land, and (2) the glacial theory, which is an attempt to explain their formation by assuming they were built up from glacial debris, morainic material, or boulder clay by the floods resulting from the melting glaciers. My study of these singular formations in New Brunswick, Nova Scotia, and the Province of Quebec for several years has convinced me that neither of these theories taken alone is competent to explain the origin and the phenomena pertaining to all our kames. The glacial theory was once held by me, but the inexorable logic of facts obliged me to abandon, or at least to modify it very considerably. At the same time it appeared highly probable that each of the agencies indicated has been instrumental in some degree in developing certain kinds of kames. In investigating these in interesting features of our surface geology for the Geological Survey of Canada I have classified them into three groups, distinguished according to locality, trend, elevation above sea level, physical and external characteristics, etc. Group I comprises all kames occurring at the sources of rivers, in lake basins, and on water-sheds, usually following the courses of streams where there are dead waters. They are not confined within narrow valleys and are almost invariably ridges with steep sides, tortuous courses, often narrow, sharp crests, peaty areas on one or both sides, and branches diverging from the main ridge. Kames of this class are found on the higher levels, above the 200 feet contour line, in localities that the sea has not reached during the quaternary age. Group II, includes kames met with in confined river valleys which are generally parallel in direction to these and composed of similar materials to the higher terraces found near them. The kames of Group III, occur along our coast and in the area near it up to the 200 feet contour line above sea level. They are usually wide and flat and often flanked by marine terraces which are fossiliferous. Those in St. John and Charlotte counties, already referred to, seem, so far as I have examined them, to belong to this class, and a long one in Restigouche is also, in part at least, composed of marine deposits. A large well formed kame occurs at the mouth of Cascapedia River, on the north side of the Baie des Chaleurs, forming its eastern bank for about 5 miles; height 100 to 150 feet. It becomes wider and higher as we proceed up river and terrace-like in places, being in fact a denuded marine terrace, shells of Saxicava, Leda, etc., having been found in its upper part. In reference to the mode of formations of the kames of Group III, there is indubitable evidence that they are, to a large extent, due to the action of marine currents, eroding beds of till, or morainic or or other materials which have been thrown down near the coast; but in some instances currents from the land would seem also to have played an important part. The fact of their being developed in greater numbers and massiveness at or near the mouths of our larger rivers, goes to show that portions of the materials have been supplied from such sources, and have been thrown into ridges partly by fluviatile and partly by marine action. The Cascapedia kame is the residual portion of a terrace denuded on the west side by the river and on the east by two or three small streams which ran parallel to it as the land emerged from the post-tertiary sea, but which have since cut passages through it. In the case of those occurring near the coast of the Bay of Fundy, the powerful tidal currents which sweep up and down, scouring its bottom and eroding the land margin, would seem to have been sufficiently strong to form them, a subject which Mr. Matthew has fully elucidated in papers and reports, and it is therefore unnecessary for me to dwell upon it. Group II, which, as already stated, occur in confined river valleys, are usually stratified, except, perhaps, in the bottom, and often flanked by terraces. Their summits never rise above the brow of the valley in which they are found, and along the St. John they seldom exceed a height of 150 feet above the surface of the river at the nearest point. Moreover, they are more regular in form than kames of the higher levels, and in places are flat and terrace like. Their general similarity as regards materials and structure to the higher terraces of the valleys in which they occur is a distinguishing feature, and the conclusion reached is that they are residual portions of these which have escaped erosion, as the river channel shifted from one side of the valley to the other. This view will be more clearly elucidated, however, when I come to speak of the formation of terraces. Group 1, presents several features and characteristics distinct from the others. The larger of these kames form conspicuous objects in the lake region of South Western New Brunswick, not being enclosed in narrow valleys. Similarly to those of marine formation they are, to some extent, morainic, but, nevertheless, contain great quantities of stratified material, and while in some parts bulky and hummocky, in others they consist of narrow ridges with steep sides. This feature and the absence of leda or other clay beds on their summits or slopes, are regarded as proofs of their supra- marine origin. Moreover, their courses invariably conform to those of the rivers or lake borders, along which they are found, while those near the coast generally have a trend parallel to it. A remarkable one in Cumberland county, N.S., called the Boar's Back, described by Sir William Dawson in Acadian Geology, exhibits features closely resembling those of the great Eel River Kame already referred to. In the Boar's Back none but boulders of local rocks (grey Carboniferous sandstones) are met with, which, in some places, seem to form a large portion of its mass. A considerable amount of discussion has taken place among geologists in regard to the genesis and characteristics of this class of Kames, and the literature of the subject is voluminous, nevertheless, up to the present no satisfactory theory has been adduced to account for them. The phenomena which they exhibit, whatever explanation be finally adopted, indicate that they bear a close relation to the drainage of the respective districts in which they are found, and their occurrence along the sources of rivers where there are dead waters, or in the vicinity of lakes, together with their sinuous, river-like courses show that the streams along whose banks they are met with have been largely instrumental in their formation, although their precise mode of action is not evident. Further study and a larger body of carefully collected facts relative to these very interesting deposits seem necessary before any theory respecting their origin which will stand the test of discussion, can be arrived at. Terraces. - These features of the surface geology of New Brunswick are here, as elsewhere, of the two kinds called river and sea border terraces, according as they are found in river valleys or along the coasts. I shall first refer to the former. Any one who has visited that part of the St. John valley, between Woodstock and Grand Falls, must have been agreeably impressed with the beauty and symmetry of the great number of terraces there exhibited. Dr. Gesner, who explored that region 45 years ago, described them in felicitous terms. Occasionally they may be seen rising in four or five steps above each other, but usually there are only two or three. Fine examples occur at Bath, East Florenceville, Salmon River, and just below Grand Falls. None of these are longer than a mile or two, however, and, generally, they are only a few hundred yards. They have more or less slope down stream, corresponding to that of the river, and in height above it vary from ten to one hundred and fifty feet. Sometimes there are upper terraces at the same elevation on both sides of the river, but this is accidental, each terrace apparently having been formed separately and independently. The materials are sand and gravel with a few small boulders, usually becoming coarser towards the summit, while the lower terraces are capped with loam to the depth of one to five feet. Boulder clay underlies them, especially in the upper slopes of the valleys. Terraces occur in all our river valleys, and in dimensions and number have a close relation to the size of the river, the depth of the valley, the drainage area, etc., of each river along the banks of which they are found. The largest rivers have invariably the largest terraces, and vice versa. In regard to the precise mode of formation of river terraces there has also been much discussion and many discordant opinions, and the explanation now generally accepted is that they were formed by flooded rivers at the close of the glacial epoch, which afterwards, owing to a decrease in the volume of water, became confined to a narrower channel and thus cut more deeply into the deposits, as it wound from one side of the valley to the other, leaving the terraces along its banks. While this explanation, considered in a general way, may be true, yet it seems to me, after a careful examination of facts, that it will, in matters of detail, have to be somewhat modified, for the following reasons:- First, it presupposes a rapid dissolution of the glacier or glaciers, which covered the country in the Ice Age, and a filling of our river valleys with a torrential flood pouring down to the sea. That there were heavy floods in the rivers of that period, especially during the summer months, seems certain, for, at that season, there would be the water due to precipitation, plus that resulting from the melting snow and ice, seeking outlet by these valleys. But the season of greatest melting would also be the season of greatest evaporation, and this would tend, in some measure, to lower the rivers and thus check the flood. That the waters filled the river valleys to the height of the upper terraces, however, - the St. John, for example, 150 to 175 feet above the present river surface - seems not only improbable, but is, moreover, for reasons given below, contrary to fact. For (a) it is now pretty certain that the ice covering was by no means as thick as has been supposed by a large number of land glacialists. Again, (b) it is only reasonable to infer that the withdrawal as well as the coming on of glacial conditions being the result of a secular change of climate would be slow, and the ice- covering would be slow, and the ice-covering would disappear by degree through a long series of years, or, perhaps, of centuries, its dissolution being probably due partly by evaporation as well as to actual melting. Its final disappearance from the area under discussion would not necessarily, therefore, be attended with such floods as have been supposed, unless precipitation were also greater than at the present day. Secondly, a flood as high as the upper terraces, that is to say, 150 to 175 feet deep, in the valley of the St. John, would in some parts of its course, as, for example, between the Grand Falls and Andover, where the descent of the river is considerable, carry away all the surface materials and scour the valley down to the solid rocks. Instead of this being the case, however, we find a great ridge of boulder clay, not eroded, remaining along the west side, besides thick deposits of stratified materials, constituting the highest and best developed terraces here, that are to be met with in the whole St. John valley. Thirdly, terraces formed by a flood, such as has been assumed to exist, ought to be long and continuous, at the same relative elevation to the river, either on one side or the other, at least in many of the straightest of river valleys; but as has been shown such do not occur. A close examination and study of the deposits in river valleys for some years has led me to the conclusion that the origin of the terraces and kames found in them has been somewhat as follows: At the close of the glacial period these valleys were, in certain places, partially filled with masses of till sufficiently thick to block them up nearly to the general level of the country on both sides. This is evidenced by the fact that such accumulations are still found occupying them in places, and sometimes causing a diversion of the river from its old pre-glacial channel. Examples of this fact can be seen at Grand Falls, St. John; the Narrows, Tobique; Aroostook falls, etc. On the final retreat of the ice of that period, the old river valleys, or such portions of them as were open between the embankments of till referred to, would be again filled with the waters arising from the melting ice and the rain fall. These waters would consequently form lakes, or chains of lakes, all tending to overflow by the lowest passage, which, in most cases, would be along the course of the old valley. Erosion and the filling up of these lake expansions with sand, gravel, etc., would then commence, every tributary as well as the main river carrying down its contribution of detritus, which, wherever the lake expansion was of any considerable size, would have time to subside before reaching the next point of outflow. Delta formations would thus be deposited in theses lakes and gradually the smaller and narrower ones would become filled towards the centre, except the passage or channel through them occupied by the river. As the embankments of till across the valley holding these large lakes became eroded and the river channel deepened through them these partially- filled lake basins would become drained, the lakes themselves obliterated and terrace after terrace appear along the sides of the valley, where it had been occupied by them. Finally, the present equilibrium between precipitation, evaporation and drainage by the rivers would be reached, and the water courses confined to a comparatively narrow part of valley as we now find them. Erosion and the deepening of river channels is still going on, however, coincident with a general seaward movement of the materials of their valleys. Portions left standing, or escaping erosion form islands, which, under certain conditions, are enlarged by periodical increments. The oldest, or first formed islands, are now, in many instances, the kames of river valleys. The loam which covers these terraces to various depths, and in a few cases forms intercalated beds, appears to consist chiefly of the fine material carried down by freshets, which have settled in the quieter portions of the flooded valleys. It has usually an unstratified appearance except, perhaps, in the bottom of the thickest deposits. The mode of its deposition and the disturbance it received after sedimentation, from rain, winds, frost, snow and subsequent freshets, as well as from the roots and stems of plants, have destroyed the traces of stratification which might have existed from the annual increments of material. That the process of forming these deposits has been a slow one seems certain. Beds analogous to them are being deposited in river valleys at the present day. None of the New Brunswick rivers have succeeded, since the glacial epoch, in eroding the drift from their old valleys down to the solid rocks. But, although there would seem, on the contrary, to be an accumulation of material in many parts of the river channels, owing to increased speed in the currents locally, yet the deepening of these channels is a secular process slowly but surely going on. Marine terraces in New Brunswick have not been found higher than 180 to 200 feet above sea level. They occur usually two or three together and occupy considerable areas in some places. Around Bathurst harbor they cover an extent of about 25 square miles, stretching along the coast line 7 or 8 miles. These terraces are not flat on the summit, except locally, but have a slight slope seaward with low undulations, representing ancient beaches, parallel to the coast line. They consist of beds of sand and gravel on top, with clay underneath, frequently holding shells of the testaceous animals which inhabited the shallow seas of that day. These deposits are called Saxicava sand and Leda clay from the presence of two of the most abundant shells met with in similar beds in the St. Lawrence valley. The fauna indicates a colder climate, or at any rate, colder seas than obtain on the New Brunswick of the present day. There is a marked distinction, therefore, between river and marine terraces, which is well to bear in mind, as those of the former kind are often supposed to have been formed similarly to the latter. But the river terraces bear no relation to the height of the sea; for, during the period of their formation, they were, as now, beyond reach. They rise in successive steps, longitudinally, as well as at right angles to the river's course, it is true; but their general height relative thereto, is nearly the same throughout, whatever slope the river channel may have, while the marine

S.J. Daily Sun - Nov. 2, 1886 Geo. F. Matthew on Friday last delighted several members of the Aftermath Chautauqua circle by pointing out the formation of the rocks in the neighborhood of the government pier, also showing the marks on the rocks made by the glaciers and boulders which had been transported by them."

Daily Telegraph - Nov. 17, 1886 Dr. Bailey's Researches. - The Great Depression at Lake Temiscouata. - In Science of November 5th is a communication from Dr. Bailey, of the New Brunswick University, relative to the great depth of Lake

Temiscouata, which empties by the Madawaska into the St. John. Dr. Bailey spent some time about the lake during the past summer in connexion with the work of the Canadian Geological Survey, and from three soundings made near its southern extremity, depths 225, 400 and 500 feet were reached, and it seems probable, adds Dr. Bailey, from his statements of reliable parties, that even this depth at some places is considerably exceeded. The surface of the lake is, by the measurement of the aneroid barometer, 400 feet above the tide level in the Bay of Fundy, so that it has a depth fully below tide level. Dr. Bailey's communication is called forth by a report of the remarkable depth of Crater Lake in Oregon, which depth, to judge from its name, is no more than one might expect from its volcanic origin. But in the case of Lake Temiscouata there is nothing of a volcanic character, and the whole depression is evidently the result of simple erosion. If this should prove to be the deepest fresh water lake in America, Dr. Bailey's contribution to geographical science is a most important one."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Daily Sun - Sep. 23, 1886 Geo. Murray, of Grand Lake, brought to the city yesterday a piece of a petrified tree. The specimen resembles coal, but there is in it a streak which looks like grey granite. Frank Potts of the country market is the possessor of the specimen."

St. Croix Courier - Dec. 1, 1887 Grand Manan.- Mr. Chalmers, of the geological survey of the Dominion government, paid South Head a visit on the 19th instant. We believe he means to visit the island again soon. We hope he may succeed in locating some of the valuable minerals on our island. We should feel contented with a gold or a coal mine."

S.J. Globe - Dec. 30, 1887 Grand Manan. - In his Geology of the Maritime Province, James Fowler, M.A., has said: On the Island of Grand Manan, Triassic trap covers the large portion of its surface. The bold cliffs of trap along the coast, rising frequently to the height of two hundred or even three hundred and fifty feet, strongly recall the same rocks facing them across the Bay. The sandstones under the trap are only exposed in a few localities, but their Triassic character is clearly revealed in their character and mode of appearance. The cavities in the trap contain quartz, calcspar, stilbite, heulandite, analcine and other minerals. Traces have been found here of copper in pockets, and nuggets of virgin copper, weighing fifteen pounds, have been discovered. Some attempts were made several years ago to open mines of copper near Bradford's Cove on the western side of the Island, but the project was abandoned. Iron pyrites and barytes are also found here, as well as agates, opals, amethysts, porphyrys, the Jasper, calcite, mezolite and the chlorite, from which the Indians fashioned their pipes and various ornaments, specimens of which are sometimes found on the beaches and the sites of

S.J. Daily Sun - Jul. 14, 1887 On a Geological Tour. - Prof. Bailey and Wm. A. McInnis left on a geological expedition to the upper St. John at noon today. After making explorations along the upper course of the St. John they intend to explore in the vicinity of Temiscouata railway now in course of construction. - F'ton Gleaner, 12th"

N.B. Reporter - Jul. 16, 1887 Prof. Bailey and A.W. McInnes went up the St. John on Tuesday on an extensive geological survey. Their operations will be confined to Temiscouata Lake."

Fredericton Capital - Jun. 11, 1887 Dr. Bailey has been elected vice president of the Geological and Biographical section of the Royal Society of Canada."

S.J. Daily Sun - Nov. 2, 1887 Natural History Society ... The lecture of the evening was given by G.F. Mathhew, M.A., on some discoveries he had made during the past season in the Lower Cambrian formation near St. John, (at Upham and Long Reach). Mr. Matthew explained that although fossil remains of animals and plants had been found in this formation in Wales, Sweden and other parts of Europe, no such discoveries had hitherto been made in America. He had, however, found in the Lower Cambrian in the localities named above, traces of the existence of worms, similar to those found in Sweden in the same formation, a brachiopod, a sponge-like form, and what was evidently a fossil alga. Mr. Matthew gave a detailed description of these and kindred forms found in the Cambrian group and his explanations were very interesting and instructive to his audience. The society passed a vote of thanks to Mr. Matthew for his interesting paper, the discoveries noted in which forms an interesting chapter in New Brunswick geology."

S.J. Daily Sun - Oct. 18, 1887 N.B. Geology. - Mr. McInnes Talks About the Result of His Explorations. - (Special to the Sun).- Ottawa, Oct. 17. - Mr. W. McInnes of the geological survey staff has just returned from the northern part of New Brunswick, where he has spent the summer exploring between the St. John river, northwest of Grand Falls, and the source of the rivers flowing into the St. Lawrence, taking in the height of land separating the tributaries on the St. Lawrence and the St. John rivers, and those running into the Bay of Chaleur. He reports that the country is devoid of valuable minerals, but in other respects it is one of the finest he has ever seen."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Globe - Jan. 23, 1889 Natural Science. - Its Progress in new Brunswick. - In the Last Thirty Years. - Mr. G.F. Matthew, president of the Natural History Society, gave an excellent address... Geology. - Dealing with the progress in Geology, Mr. Matthew presented for comparison the first attempt made in a map to delineate the Geology of New Brunswick - supposed to be the work of Dr. Gesner, and the finishedwork of the Geological Survey of Canada, and he pointed out the principal features in Dr. Gesner's work. He also referred to Dr. Robb's Geological labors, and then continued: I have not yet referred to that branch of geology which relates to the study of organic remains found in the rocks. Dr. Gesner, finding so few organic remains in the older stratified rocks of the southern counties, classified them as Grauwacke, because this group as studied in Europe, was distinguished from the Silurian, which had been divided off from it, by the scarcity of organic remains. In the slates of this group on the 'ravine' now crossed by Wright street, in Portland, he found a solitary 'terebratulite,' which though now lost I incline to believe may have been the Othis Billingsi of Hartt. So that a formation (terranis) which he found, characterized by a single fossil, is now known to contain many kinds of organisms, and to abound at several different levels with the remains of creatures that swarmed in the primeval seas of Acadia. Mr. Matthew

recalled the wonderful flora of a past geological age found on both sides of our harbour which was only indicated to Dr. Gesner by a fossil tree, discovered near Little Harbor, and which to him certified the existence of imperfect coal measures. Only in our time has this flora been revealed in its full richness of fern and fruit and flower. He spoke of the discovery by a member of the society of new forms of animal life in these prolific beds, and he pointed out that the advance of knowledge in the geology and natural history of this district centres in the Natural History Society. Of the club of young naturalists who formed the working members of this society in its earlier days, the late Charles F. Hartt was certainly the most zealous, and his departure from St. John was a great loss to us. To habits of indefatiguable industry and rare power of discernment as a naturalist he united a kindly spirit and a personal magnetism that enabled him subsequently to exercise over the young men who came to him for training a power similar to that possessed, in such a remarkable degree, by his instructor at Cambridge, the lamented Agassiz. The investigations set on foot by this club in and around St. John, and especially the work done by Mr. Hartt, resulted in the establishment of a new basis of development for the Geology of the Province; and the tract of country along the Southern coast which Dr. Gesner had said was occupied by rocks of the Grauwacke formation, and Dr. Robb had colored as Upper Silurian, was found to be occupied by a variety of formations representing a much greater extent of geological time than had been suspected by either of these geologists. Both Dr. Gesner and Dr. Robb were in part right, because the tract contains Cambrian or Grauwacke slates and sandstones, as well as those of the Upper Silurian system. But with these are other rocks some of which are as old as the time of Eozoa, the Dawn Animal, and others as the beginning of the Carboniferous age. To express the long chequered history of this narrow belt of land, it will no longer do to sweep across it with a uniform color, but the requisite distinctions must be made by the devices of the map maker which will express to the eye its varied geology. The explorations which had this result were begun, as I have said, by the naturalists of the club which formed the original nucleus of this society; and with their aid the work done in one short season by Dr. L.W. Bailey, when engaged on the Geological Survey of Southern New Brunswick, under the direction of the provincial government of 1864, quite revolutionized the views which had been held of the structure and age of the Grauwacke formation. The work of the Geological survey of Canada has from this starting point now been extended to distant parts of the province, but the study of structure and the Geological history of the hills around our city still goes on, being carried forward by the members of this society. ...."

Evening Gazette - Jul. 26, 1889 Dr. Bailey and Mr. I. Bailey of the Geological Survey of Canada are in town today as is also Mr.Chalmers of the same survey."

N.B. Reporter - May 11, 1889 In Ottawa. - At the meeting of the Royal Society in Ottawa on Wednesday, Prof. Bailey of the University N.B. read a paper giving a critical review of the progress of geological investigation in New Brunswick during the past twenty years. A brief summary of the progress made in the study of the natural history of the Province was also

N.B. Reporter - May 18, 1889 Dr. Bailey of the University N.B. and his staff of engineers including Mr. McInnes, will continue the geological survey of the Temiscouata and Madawaska during the present summer."

Fredericton Capital - May 25, 1889 The geological survey in the maritime provinces this season will be carried on as efficiently as usual. Dr. Bailey and Mr. McInnis will continue their survey of Temiscouata and Madawaska. Mr. Chalmers will make a surface survey in southern New Brunswick, and Messrs. Fletcher and Faribault in Pictou and Halifax."

Evening Gazette - May 27, 1889 Dr. Bailey of the University, N.B. and his staff engineers including Mr. McInnes, will continue the geological survey of the Temiscouta and Madawaska during the present summer."

Evening Gazette - Nov. 6, 1889 The Natural History Society. - There was a very full attendance of the members of the Natural History Society at their rooms last evening when Mr. G.F. Matthew delivered an interesting lecture on the Life and Works of the late Prof. C. Fred Hartt. The industry and scientific skill of Prof. Hartt were shown in the beginning of his explorations near St. John, chiefly in studying the plants and insect remains of the Devonian rocks atLancaster. This was a far more complete exploration than had before been attempted in the maritime provinces; and as an instance of its completeness Mr. Matthew said that no new plants had since been found in the Devonian rocks studied by Mr. Hartt. His finding of insects in the rocks made his fame world wide. In future the rooms of the society will be open each week on Tuesday evening and Saturday afternoon."

Codes: GEOL / IDX_Names: Geology - General;
Fredericton Capital - Nov. 16, 1889 New Brunswick Minerals. - As a book of reference and perhaps a stimulus to exploration, a succinct yet comprehensive statement of the location and extent of known deposits of valuable minerals in New Brunswick, with a description of the commoner ores and the most ready tests would be very useful. Dr. Bailey, of theUniversity, could prepare the matter in the most desirable form, as he has the faculty of handling his subjects with great clearness and in terms readily understood by the non-scientific reader. The cost would not be large. Properly it ought to be borne by the Dominion Government, which although it has expended a great deal of money in the geological survey has yet to make public any of the results in a popular form. It is true that the Geological Survey does not concern itself with locating mineral deposits of economic value, and that Dr. Bailey, or any other gentlemen, who might prepare a compilation of the character mentioned, would have to resort to other sources of information than the valuable reports of

the surveying parties; never the less the duty of giving the public information of this character is one which the people at large considers the federal government as having assumed. While urging only the claims of New Brunswick, it will be admitted of course that each Province of the Dominion has equally strong case in this regard; but they should be dealt with separately. Inquiries are frequently made for such information in respect to New Brunswick, but they cannot be answered in anything like a satisfactory manner."

S.J. Daily Sun - Oct. 8, 1889 Natural History Society. - An Important Discovery at Green Head. - Mr. Matthew Discusses Eozoan Acadiense. - ... The president ... called special attention to a remarkable slab of marble that lay on the table and had the appearance of petrified sticks of wood..."

S.J. Daily Sun - Oct. 29, 1889 Geology of New Brunswick. - Parts M and N of the annual report on the geological survey of Canada for 1887, have been issued. The former, by Messrs. L.W. Bailey and William McInnes, treats of portions of northern New Brunswick and adjacent areas in Quebec, and Maine, U.S. The latter, by R. Chalmers, covers the surface geology of the northeastern part of the province. They may be had from Messrs. Wm. Foster Brown & Co., Montreal; price 25 and 20 cents respectively. -[Montreal Gazette."

Daily Telegraph - Apr. 9, 1890 Prof. Bailey on Railway Geology. - The members of the Natural History Society assembled last evening to listen to a very interesting paper from Dr. L.W. Bailey. His subject was Railway Geology. The professor treated the subject from three points of view, viz.: First, the advantage to the railway engineer of a knowledge of geology; second, the gain to a railway traveller of a knowledge of the country through which he passes, and third, the opportunity they afford to the young student of geology for obtaining an insight into the knowledge of the science which he is acquiring. At the meeting of the Geological Congress at Philadelphia an opportunity was given to the members of the congress to see the geology of the vicinity of that city by trips on the railways around, and the value and interest of these excursions were greatly enhanced by the geological map which was put in the hands of each member. A great many facts concerning the geology of New Brunswick could be obtained by observations along the Intercolonial and New Brunswick railways. The professor gave an outline of the structure of New Brunswick, geologically speaking, as observed along the line of these two railways, and added some interesting remarks about the remarkable terraces on the upper St. John, which elicited considerable discussion. After the reading of the essay there was a discussion on the subject among several of the members, and a vote of thanks given to the lecturer."

S.J. Evening Gazette - Apr. 9, 1890 Dr. L.W. Bailey, of the University of New Brunswick read an interesting paper on Railway geology before the Natural History Society last evening. The lecture was highly appreciated by those present, and at its conclusion a discussion took place on the subject. The lecturer was tendered a vote of thanks."

S.J. Globe - Aug. 23, 1890 Geological Finds. - The workmen who dig in the streets for sewers and water pipes often come across specimens extremely interesting to a geologist. On Thursday some of the water works men digging at the corner of Charlotte and Duke streets found, about ten feet from the surface, embedded in a bank of soft clay, an oyster with the shells wide open. Mr. Murdoch has the curiosity in his office."

S.J. Daily Sun - Aug. 23, 1890 St. John Exhibition.- The Prize List for the Natural History Department. - Economic Minerals and Ores of Canada. - Salt, fine or course - Diploma Ochres and other mineral paints, best collection of - Diploma Gypsum, best collection, crude and calcined, and raw plaster, ground - Diploma Marbles and Ornamental Stones (2x3 feet), best collection of - Diploma Clays and sands for bricks, pottery, moulding, and glass- making, collection of - Diploma Natural cements, best assortment of, for building purposes, exhibitors to be present with the judges to have tests made - Diploma Artificial cements, best assortment of, for building purposes, exhibitors to be present with the judges to have tests made - Diploma Lime - best exhibit - Diploma Asbestos and its manufactures, if exhibit is worthy - Diploma Mica, in mass and large sheets, labelled with locality where found - Diploma Iron ores, 6 varieties, not less than 3 pounds in weight each - Diploma Manganese ores, not less than 3 pounds in weight - Diploma Copper ores, large specimens, each not less than 3 pounds in weight - Diploma Gold and silver ores - Diploma Lead ores, large specimens, each not less than five pounds in weight - Diploma Plumbago and its manufactures, large specimens, each not less than 1 pound in weight - Diploma Coal, best exhibit - Diploma Granite, worked, best exhibit - Diploma Pottery, best exhibit - Diploma Bricks, best exhibit - Diploma Best collection of mineral and geological specimens, properly classified and described. 1st $10, 2nd $5. Best collection of mineral and geological specimens, as in above, by students under 18 years of age, 1st $5, 2nd Diploma Best archeaological collection, eligible, 1st $10, 2nd Diploma."

Codes: GEOL / IDX_Names: Geology - General;
Weekly Record - Fri. Jan. 31, 1890 Edward Jack, Esq. of Fredericton, who spent somedays in Sussex inquiring into our mineral resources, has returned to Fredericton."

S.J. Evening Gazette - Jul. 11, 1890 Mr. R. Chalmers, of Ottawa, of the Dominion Geological survey and his assistants, Mr. Fred Wilson of St. John and Mr. John McDonald, of Brockville, Ont., are in Richibucto studying the surface geology of that section of Kent Co."

Daily Gleaner - Jun. 17, 1890 Currie's Mountain Sold. - Mr. John Black has bought from Mr. Wheeler, its former owner, for Mr. Augustus V. Marckwald, of the firm of Whitehouse & Co., bankers, New York, Currie's Mountain, situated in Douglas a few miles above the city. It is not known what Mr. Marckwald's purpose is, but there is a rumor that he has purchased it, believing that the mountain contains some valuable mineral deposits. The price paid is $600."

S.J. Daily Sun - Nov. 4, 1890 Dr. Gesner. - A.J. Pineo, instructor in mineralogy in the summer school of science, is preparing an account of the late Dr. Abram Gesner, who practised here some 50 years ago. No doubt there are people in this vicinity still living who remember the doctor and know something of his work as a geologist and mineralogist. Mr. Pineo would be very glad to communicate with such people or with any one that can give any information desired. His address is

St. Croix Courier - Nov. 13, 1890 Mr. Edward Jack has great faith in the mineral advantages of New Brunswick. At a meeting of the board oftrade at St. John he suggested the establishment of smelting works in that city, and felt satisfied that charcoal iron could be manufactured in St. John at a cheap rate. It transpires, however, that the work can be done so much more cheaply in Nova Scotia that the persons with whom Mr. Jack is acting will erect their works in that province."

Evening Gazette - Oct. 10, 1890 The Surface Geology of New Brunswick. - The Gazette has on more than one occasion directed attention to the important work that was being done by the staff of the geological survey of Canada, in respect to the surface geology of New Brunswick. This work was commenced six years ago, and has been continued ever since under the direction of Mr. Robert Chalmers, a native of this province. The work of the survey consists of examining the superficial deposits in reference to their origin and distribution, more especially as to the nature of the soil. When the work is completed, and the maps are published they will show the character and value of every square mile of soil in the province, and also the character of the forest growth of the country. About a third of the province, comprising the counties of St. John, Charlotte, Kings, Queens, Restigouche, Gloucester, and parts of Albert, Westmorland and Kent, have already been gone over and a portion of the results published. The results of the remaining part of the survey, so far as completed, will be made public some time during the next session of Parliament. The Gazette has already expressed the opinion that this work is as important asany in which any department of the government is engaged, and that the results are likely to be of incalculable value to the province of New Brunswick. It will probably be five or six years before the work is completed, at the present rate of progress, but it would be better to put a larger force on and complete it in less time. When the work is done we should for the first time have an official survey, of the most thorough character, of the soil of the entire area of the Province. It is unnecessary to enlarge on the value of such a record, but its value will be greatly lessened if the fullest publicity is not given to the maps and the descriptions which accompany them. The provincial government ought to publish and distribute as widely as possible a summary of the work that has already been done, as a guide to settlers and for the purpose of showing the value of our agricultural resources."

Daily Telegraph - Sep. 20, 1890 Mr. Chalmers, geological surveyor, has passed through this section of the country."

Daily Telegraph - Jan. 21, 1891 Natural History Society. - ... The geological committee recommended that interest in local geological work be revived either by means of a summer camp or some similar design. ..."

Moncton Daily Transcript - May 8, 1891 Mt. Allison ... Prof. W.W. Andrews..... The vast mineral resources of the Canadian Atlantic seaboard will yet be developed. And when this development takes place the capitalists who take these enterprises in hand will be forced to pass by young Nova Scotians and New Brunswickers and call in the graduates of the technical colleges of the United States, England and Germany, to act as engineers, chemists and managers. Is justice being done to our men when no place is provided where they may receive the necessary training?"

Fredericton Daily Gleaner - May 19, 1891 Geological Excursion. - This morning a large bus took a number of the university students, chiefly seniors, in charge of Prof. Bailey, on a geological excursion about six miles up the other side of the river. The buss started at ten o'clock and the party of young ladies and gentlemen looked as though they intended to have a

Evening Gazette - May 23, 1891 A Geological Survey. - Mr. McFarlane, of the Fredericton Gleaner staff came down from Fredericton today, and on Monday, will start from Moncton in the steamer Arbutus, with Professor Colwell and a number of college students, to make a geological survey of the Basin of Minas, N.S."

Codes: GEOL / IDX_Names: Geology - General;

Weekly Record - Fri. Nov. 6, 1891 In our last issue we took occasion to speak of a mineralogical collection for the province. At the same time we advocated having a provincial assay office wheresamples might be tested at a moderate cost by those desirous of prospecting or opening up mineral deposits in the province. We since learn by the courtesy of a friend that Mr. Alfred A. McIntyre, F.C.S., analytical chemist of No. 9 Dock Street, St. John, was appointed provincial assayer about four months ago, and that the appointment was duly published in the Royal Gazette. As we had not seen the Gazette or missed seeing any mention of it in our exchanges if it appeared we were not aware of any such appointment. We are glad to know that such is the case and understand Mr. McIntyre is a very capable assayer and trust his services will be in constant demand. The mineralogical collection should be started at once. We might also say that we understand Mr. McIntyre has been selected by the committee of the university extension course to deliver the lectures on chemistry to be held in St. John during the coming winter."

Moncton Daily Transcript - Nov. 6, 1891 Messrs Chalmers and Wilson of the government theological survey, who have made Moncton their headquarters this summer, while surveying in different places in Westmorland and Albert, went north today for Harcourt where they will complete surveys begun last fall."

Daily Telegraph - Nov. 9, 1891 A New Survey. - The Moncton Transcript says: Messrs. Chalmers and Wilson of the government theological survey, who have made Moncton their headquarters this summer, while surveying in different places in Westmorland and Albert, went north today for Harcourt where they will complete surveys begun last fall. Harcourt clergymen will doubtless profit by this timely warning."

Moncton Daily Transcript - Nov. 21, 1891 Messrs Chalmers and Wilson, of the Government geological survey, who have had their headquarters at Moncton all summer, have finished work for the year. This morning Mr. Chalmers went north to Belledune where his family is, and Mr. Wilson went to his home in St. John."

Daily Telegraph - Nov. 27, 1891 Geological Survey. - Messrs. R. Chalmers and W.J. Wilson of the geological survey were in Sackville lastweek working up material for charts of the surface geology of that part of Westmorland county. The maps are expected to be published in a few months."

Moncton Daily Times - Nov. 27, 1891 Geological Survey. - Messrs. R. Chalmers and W.J. Wilson of the Geological survey were in Sackville lastweek working up material for charts of the surface geology of this part of the country. The maps are expected to be published in a few months."

S.J. Daily Sun - Oct. 9, 1891 Surface Geology of St. John, etc. - The Baron de Geer of Stockholm, a member of the Swedish geological survey, has for the past week been examining some points of interest in the surface geology of St. John and vicinity. He is especially interested in tracing out the upper limit of the Pleistocene submergence of the neighborhood, and has made examination of the region about Mount Prospect on the Black River, where an oldshore line is traceable. He intends visiting other parts of Canada, and left yesterday morning for Digby. In a few days he is to reach Amherst, where, in company with Robert Chalmers of the Canadian geological survey, he proposes to examine the excavations at the west end of the ship railway, where there are traces of an old forest bed. Afterwards they expect to visit the Bay Chaleur region and trace out the old pleistocene shore lines exposed there. Mr. Chalmers, who has been assisting Baron de Geer in his researches here, showed some years ago in his geological survey reports that evidence existed of a submergence of some two hundred feet in the post tertiary period, and Baron de Geer who has made a special study of these matters in his own country, finds on examination that Mr. Chalmer's conclusions are correct. On the baron's return he expects to publish the results of his researches."

Evening Gazette - Oct. 9, 1891 The Baron De Geer of Stockholm, a member of the Swedish geological survey has for the past week been examining some points of interest in the surface geology of St. John and vicinity. He is especially interested in tracing out the upper limit of the Pleistocene submergence of the neighborhood, and has made examination of the region about Mount Prospect on the Black River, where an old shore line is traceable."

S.J. Globe - Oct. 10, 1891 Mr. W.J. Wilson, second master of the Leinster street school, has received an appointment on the geological survey, and will remove at once to Ottawa, there to reside. The city loses an excellent teacher by Mr. Wilson's removal."

Daily Times - Oct. 22, 1891 Geological Discoveries. - Amherst, Oct. 20. - Mr. Chalmers, of the geological survey of Ottawa, his assistant, Mr. Wilson, of St. John, and Baron deGeer, state geologist of Sweden, accompanied by Mr. E.J. Lay of Amherst, spent last Friday afternoon at the Fort Lawrence terminus of the Chignecto ship railway examining the deposits laid bare by the excavations for the dock. The deposits were found to be made up of (1) marsh mud, (2) peat, (3) bed of sunken forest, (4) stratified sand and gravel, (5) boulder clay. The baron measured the depth of the sunken forest and found that while at the west end it was 30 feet below high water mark, at the east end it was only four or five feet. Mr. Wilson found among the deposits a new shell, while a specimen each of macema and rhissoa minutia were found in abundance in the deposits above the forest. The baron is seeking for evidence of glaciation, raised beaches, etc."

Codes: GEOL / IDX_Names: Geology - General;
Moncton Daily Transcript - Oct. 22, 1891 Geologists in Moncton.- On Saturday last there arrived in Moncton from Amherst Mr. Chalmers, of the geological survey, Ottawa; his assistant, Mr. Wilson, of St. John, and Baron de Geer, state geologist of Sweden. Accompanied by Mr. E.J. Lay of Amherst, these gentlemen had made a survey of the Chignecto Marine Railway and examined deposits laid bare by dock excavation."

S.J. Daily Sun - Oct. 23, 1891 and Daily Telegraph - Oct. 21, 1891 Geologists at The Ship Railway. - On Friday last Mr. Chalmers of the geological survey, Ottawa; hisassistant, Mr. Wilson of St. John, and Baron de Geer, state geologist of Sweden, accompanied by E.J. Lay, visited the Fort Lawrence terminus of the Chignecto marine railway and examined the deposits laid bare by the excavations for the dock. The deposits were found to be made of: First, marsh mud; second, peat; third, bed of sunken forest; fourth, stratified sand and gravel; fifth, boulder clay. The baron measured the depth of the sunken forest, and found that at the west end of the dock it was 30 feet below high water mark, while at the east end it was only about four or five feet below. Mr. Wilson found in the deposit a new shell, while a species each of macema and rhissoa minutiae were found in abundance above the deposit of the sunken forest. - [Amherst Sentinel."

Evening Gazette - Apr. 22, 1892 Dr. S.T. Gove estimates from observations he has made that the warring of elements during the last thousand years has worn seven inches off the crown of Chamcook mountain. It is painful to contemplate that if any of us should happen to be around St. Andrews one million years from hence, Chamcook, as a mountain, would not be in it. - St. Andrews Beacon."

Daily Telegraph - Aug. 25, 1892 Dr. Selwyn, director of the geological survey,Ottawa, is at the Dufferin."

St. Croix Courier - Feb. 25, 1892 St. George. - Through the kindness of Dr. Selwyn, director of the geological department, Ottawa, the highschool has been presented with fine collection of minerals."

Daily Telegraph - Jan. 29, 1892 Geological Department Changes. - In accordance with the provisions of the act respecting the geological survey passed in the session of 1890, an order-in-council has been passed confirming Mr. Alfred Richard CecilSelwyn, C.M.G., in the position of deputy head and director of the dominion geological survey department at a salary of $4,000 per year. The staff under Mr. Selwyn, in view of their appointment as technical officers, cease to hold rank in the civil service as clerks, first, second or third, as the case may be. Scott Barlow, first- class clerk in the geological survey department, has been promoted to be chief clerk and geographer at a salary of $1,800 per year. Henry P. Brumell is promoted to be a clerk of the second class at the minimum salary of that class, viz., $1,100 per annum."

Richibucto Review - Jul. 14, 1892 Concerning the World's Fair, Chicago. - Editor of the Review. - Sir, - Will you kindly allow me the use of your columns to say, that having been appointed as agent for New Brunswick in connection with the working up of exhibits at the World's Fair, Chicago, in 1893, it will afford me much pleasure, to furnish all intending exhibitors with blank forms of application and such other information as I can in connection with the same. I shall visit the various sections of the province at as early a date as practicable and trust that there may be a well-defined effort to make as good a showing as possible of the resources as the provinces of Ontario, Quebec, Nova Scotia, and P.E. Island are moving actively in the matter. The space at command of the executive commissioners for Canada is limited, and it would be well for intending exhibitors to make application at an early date, so that the allotment of space can be definitely arranged. The Dominion government will pay the transportation charges on all exhibits, going and returning, and the placing of articles sent. The reception of articles at the exposition buildings will commence on the first of Nov. next, so that it will be seen that prompt and energetic action is necessary, to insure the success of New Brunswick's exhibit. I am sir, yours truly, E.A. Charters, agent for N.B. Sussex, N.B. July 11, '92."

S.J. Daily Sun - Jun. 2, 1892 Local geologists will find something to interest them in the excavating now going on for the foundation of MacAuley Bros. new King street building. Pockets of gravel have been discovered among the slate rock, also petrified coal black oysters and a good specimen of iron pyrites."

Evening Gazette - Jun. 17, 1892 and Daily Telegraph - Jun. 17, 1892 The Geological Survey. - Mr. Chalmers, of the government geological survey, is working about the North Shore this summer mapping out the surface geology of the places through which there are no roads. Mr. Wilson, of the survey, left yesterday for Amherst, where with an assistant he will spend the summer completing the surface geology maps of Cumberland and Westmorland counties."

Codes: GEOL / IDX_Names: Geology - General;

Daily Telegraph - Mar. 3, 1892 University Extension Course. - The lecture on geology last evening by Mr. G.F. Matthew was given to an account of the Devonian and carboniferous ages, and was prefaced by an outline of the classification of plants found on the earth at the present day. Of those thatexisted now, only certain types had appeared in the early times. The chief among these were representations of the club mosses, ferns, pines and horsetails. Some other striking types as the sigillaria and the cordaites were described. Besides this outline of plants, a sketch was given of the principal divisions of the fishes, of which all but the telcosts or cycloids (bony scaled fishes) were found in carboniferous and Devonian times. The coal measures were the most remarkable features of the carboniferous deposits in this country, and the Devonian is remarkable for its gigantic placid fishes, though in that neighborhood it was not the fishes that made it remarkable, but the plants, of which many perfect specimens were found near St. John. The carboniferous was remarkable for large numbers of fishes with rhombic long scales. With the close of Cambrian time he passed to a new order of things, when reptiles, etc., were found, and the plants began to resemble more nearly those of modern times."

Evening Gazette - Mar. 9, 1892 This Evening. - The sixth lecture of the course in geology will begin at the Natural History society rooms this evening at eight o'clock; subject, History of the Secondary and Tertiary Ages of Geology."

Moncton Transcript - May 17, 1892 District Geology. - The Dominion Geological Survey Report this year states that the land at present was once 235 feet lower than at present, and that the Bay of Fundy and Straits of Northumberland were connected even up to this point. The report also refers with approval to the tiding of the Tantramar and other marshes as a means of restoring them to their original fertility. Reference is also made to the big manganese deposits of Albert County."

S.J. Daily Sun - May 23, 1892 The Geological Survey. - W. Wilson, who, last year, resigned his position as a teacher in the St. John schools to take a place on the staff of the geological survey, has been in town the last three or four days. He finds work at Ottawa quite congenial. Mr. Chalmers and he have completed the maps and detailed report of lastyear's operations in this province. Mr. Wilson has spent much of his time after hours in the museum of the survey. During his stay in St. John he has been getting together some specimens from local sources to make good deficiencies in the collection at Ottawa, or to replace less perfect specimens. He and Mr. Chalmers are to work together in this province as usual. This season's survey will begin in the Miramichi district. Mr. Chalmers is already on the North Shore. Mr. Wilson

S.J. Daily Sun - May 24, 1892 Sussex. - The Sussex grammar school has been the recipient of a handsome collection of minerals from the geological department at Ottawa, procured for them through the efforts of E.A. Charters of this place. There are one hundred samples all catalogued, and they will no doubt prove of much service to the scholars."

S.J. Daily Sun - May 20, 1893 and Evening Gazette - May 20, 1893 The Geological Survey. - Wm. Wilson of thegeological survey staff, came to St. John yesterday. His working companion, Mr. Chalmers, is at Belledune. They will meet early next week and proceed to the first part of the coming season's work in the northern part of Prince Edward Island. Later in the season Messrs. Chalmers and Wilson will be at work in the central counties of New Brunswick."

Evening Gazette - May 22, 1893 Dr. Bailey of the Provincial University, and Dr. McKay, superintendant of education of Nova Scotia, were in the city and left last night for Ottawa with Mr. G.F. Matthew and Mr. G.U. Hay, to attend the annual meeting of the Royal Society. Mr. Hay attends as the representative of the Natural History Society."

N.B. Reporter - May 24, 1894 Messrs. W. McInnis and R. Chalmers, of the Dominion Geological Survey, will soon resume their field work in this Province again. The survey will be under the direction of Dr. Bailey, of the University."

S.J. Daily Sun - Nov. 5, 1894 Not Fossil Fish. - Some weeks ago the Sun published an item stating that a fossil fish had been dug up by a man who was excavating a cellar at Hopewell Hill, Albert Co. This fossil has been presented to the Natural History society, and examination by one of the geological committee reveals the fact that it is the fossil root of a tree known to science as stigmaria ficoides. These trees flourished in the carboniferous age and were spread from Newfoundland to Alabama and from theAtlantic ocean to the Rocky Mountains, thus showing a uniformity of climate unknown in modern times. They were cone-bearing trees of a low type, and grew to a height of 20 or 30 feet. They grew in swamps and the roots seemed to have spread out under the ponds and lagoons. Associated with them were Calamites Sigillaria, Ferns and Lepidodendra, the latter probably the most beautiful trees of that period. The Stigmaria ficoides flourished all through the central area of New Brunswick, but elevation of the land and climatal changes of succeeding ages swept it away, and its place was taken by new forms suited to the new conditions."

Codes: GEOL / IDX_Names: Geology - General;

Daily Sun - Nov. 14, 1894 The Natural History Society. - George F. Matthew Talks About the Outlets of the River St. John. - The rooms of the Natural History society were crowded totheir utmost capacity last night, to hear Geo. F. Matthew talk about the outlet of the River St. John. On the walls of the room were hung colored sketches of the topography of the region about St. John as it appeared from Huronian to post-Pleiocene times. In introducing his subject, Mr. Matthew said that no river on the Atlantic seaboard had the peculiarities which gave such special interest to the St. John. It is difficult to find a river 440 miles long and only 400 feet wide at its mouth, or with the peculiar tidal rapids which gave such constant variety to the outlet of this river. The history of the valleys which give passage to the St. John near its mouth goes back to the remotest period of geological history, and almost to the dawn of life upon the earth. At the close of the Huronian age only the simplest organisms existed, such as protozoa, seaweeds and marine worms. This age was one of great physical disturbance in this province. The solid crust of the earth was broken and vast quantities of lava were poured forth. At New River, in Charlotte Co., these lava beds are 10,000 feet thick. The Kingston range of hills, extending from Beaver Harbour to Norton, was thrown up at this time, and is only a few miles wide. This shows that there were profound faults along each side of this range, with probably a sinking area between, into which and on which the lava streams were poured. The faults were the initial lines of valleys which continue to exist to the present day. In the Cambrian age all the volcanoes had died out, the sea covered all the region near the city save a few projecting hills, and on the lava beds was spread the sand and mud containing the shells and molluscs and tests of trilobites. This deposit attained a thickness of 4,000 feet, and in time a resistless pressure from the south doubled it over on itself. This overfold revealed a great fault within the city limits, running along the marsh and valley, the upper part of the harbor, from Mill street, past the Straight shore and the Lunatic

Asylum and beyond. After sketching the changes which took place in Devonian and carboniferous times, Mr. Matthew stated that at the close of the Paleozoic ages there was no St. John river. The next grand division of time includes the Mesozoic ages, and, so far as the St. John is concerned, is a total blank, as no vestige remains to tell of what took place; but some time in this period the St. John river began. Walcott has estimated this period of time at ten millions of year, but the record here is a complete blank. Probably it was a time of elevation, when the rivers cut deep valleys and the edge of the ocean was off towards Nantucket and Sable Islands. In the glacial period many changes took place, and channels of many river were turned from their former beds. Such was the case with the St. John, both at Grand Falls and at its present outlet. The conformation of the land between South Bay and Pisarinco renders it highly probable that this was the course by which the river entered the sea before the glacial period. A later outlet, now closed, existed at Drury's Cove. At the head of the cove is a low pass. Only 15 feet above high water mark, connecting with a long, narrow valley called the Marsh, ending in Courtenay Bay. In concluding, Mr. Matthew said that the matter might be stated thus: 1st. The St. John river is built up of three river systems, once independent of each other. 2nd. That the river has availed itself of several very ancient valleys for its present outlet. 3rd. That the pre-glacial discharge was by a buried valley on the line of South Bay and Pisarinco Cove. 4th. That there was a post-glacial subsidiary outlet by way of Drury's Cove and the marsh to Courtenay Bay. After a number of questions had been put and answered the meeting adjourned."

S.J. Daily Sun - Sep. 19, 1894 Albert Co. - Hopewell Hill, Sept. 17. - A very fine specimen of fossil fish was found one day recently by Chesley Smith of this place, while he was digging in his cellar. The fossil shows a section of the fish about a foot in length, very plainly marked, the size of the vertebrae indicating that the fish had been of considerable proportions. Local ichthyologists favor the idea that it may have been a shark."

N.B. Reporter - Apr. 3, 1895 Dr. Bailey, University N.B., lectured before the St. John Natural History Society last evening on A visit to the Anthracite Regions of Pennsylvania ."

Moncton Daily Times - Apr. 8, 1895 Alma, April 6. - The day school here has just received a cabinet of minerals and rocks, presented bythe geological survey department, Ottawa. The collection consists of one hundred and thirty-five excellent specimens, all Canadian."

Codes: GEOL / IDX_Names: Geology - General;
Daily Sun - Apr. 8, 1895 The Great Post-Glacial Lake of New Brunswick. - In the account published of the proceedings of the Natural History society on Tuesday night, 2nd inst. A slight reference was made to the statement of Robert Chalmers in regard to a post-glacial lake, traces of which he had lately discovered. In his paper Mr. Chalmers speaks as follows: The barriers of boulder clay and marine deposits which existed around the mouth of the St. John at this period (the post glacial), held in a great fresh water lake, extending along the valley of the St. John as far up as Keswick river and beyond it, of which Grand Lake and Washedemoak lakes, Belleisle bay, etc., are remnants. As this was a new proposition and some members of the society were anxious to have further information in regard to it, Mr. Chalmers was written to and kindly forwarded some additional remarks, together with a map showing the boundaries of the lake so far as traced. Mr. Chalmers writes as follows: It was only the St. John where it crosses the carboniferous area, and in the lake region and at Sussex Vale, that we were really able to locate it. In the area where the lacustrine shore lines were located, they occur only as detached terraces, ridges and mounds of gravel, and seem similar to formations now in process of development at Douglas Harbour, the Keyhole, Sypher's Cove, etc., on the west side of Grand Lake. The intervals between these detached terraces and mounds are usually without traces of shore lines, but from their nearly uniform height (80 to 100 feet) above the present level of the St. John in tidal waters, it was inferred that they represent a high water mark. And as no marine deposits have been found above the head of Long Reach, we naturally attributed these to the action of a former lake at that level. At first we thought this lake might have been confined to the central carboniferous basin; but the occurrence of apparently similar deposits at a few points around Sussex Vale and in the valley of Studholm's Millstream, led us to conclude that these valleys were also embraced in this lacustrine area. As the sea occupied the Kennebecasis and Belleisle valleys at a previous date, however, and left terraces along their sides, it is very difficult, perhaps impossible in some cases, to differentiate the marine from the lacustrine deposits there, and it will require a good deal of time and care to work out the details. Farther, as there are a number of facts which go to show that the ridges of crystalline rocks underwent greater changes of level than the apparently stable carboniferous basin, with probably some deformation or warping, the correlation of shore lines within the area of pre-carboniferous rocks becomes an exceedingly complex question. Mr. Chalmers also stated that these investigations would be continued in the field, with a view to procuring further data. Prof. L.W. Bailey, in referring to the 'lake', drew attention to the great expanse of water which is found in the central basin during freshet time. High freshets even now join Grand, Maquapit, Otnabog and other sheets of water into one great lake-like region. No doubt in the Champlain period, a time flooded river valleys, numerous lake-like areas existed, and may have formed such deposits as those referred to by Mr. Chalmers. He thought, however, that further evidence would be needed to show that those lake- like areas were connected as parts of one great lake. Prof. Bailey referred to a paper read by W.T.L. Reed before the society in 1884, in which Mr. Reed put forth a theory in regard to this great Acadian lake, which he estimated had occupied an area of 300 square miles. It is hoped that the geologists of the province will give the matter

S.J. Daily Sun - Mar. 6, 1895 Hopewell Hill, Feb. 26. - A.C.M. Lawson, of the superior school at the Hill, has received from the geological survey department, Ottawa, a handsome and complete cabinet of Canadian mineralogical specimens, which will prove a most valuable acquisition to the school equipment. The cabinet contains 135 specimens, comprising all the minerals of Canada, and is splendidly arranged in compartments, with an accompanying catalogue containing the name and description of the specimens and where they are found. The cabinet is the property of the school."

Daily Sun - May 8, 1895 Natural History Society. - ... The paper of the evening, on The Volcanic Rocks of the Maritime Provinces, By W.D. Matthew, was then read for the author by the president [Geo. F. Matthew]. In the introduction it was stated that the maritime provinces was a good field in which to study the volcanic rocks of the Atlantic coast, because they occur in great abundance, have been recognized as such for many years, are very little altered, and in most cases their age is well known. The general geologic structure of New Brunswick was then explained in brief as consisting of three areas of very different geologic features. In the south a rugged, hilly region of complicated geology, consisting of ridges of metamorphic rocks; to the north of this lies a triangular area of Carboniferous rocks, flat-lying, seldom over 30 feet high, fronting on the Gulf of St. Lawrence; northwest of this lies the great Silurian area, mostly high, rolling country, underlain by slates. The formations represented range from Precambrian to Triassic. As early as 1838 Dr. Gesner recognized masses of volcanic rocks in this province, but erred in supposing them to be of recent origin. From the Precambrian down to the Triassic age New Brunswick must have been the seat of great, though intermittent, volcanic activity. Rocks known to be eruptive cover a considerable part of the province, and their thickness is locally enormous. The oldest rocks in the province are the gneisses and limestones forming the Laurentian. Over the Laurentian are great beds composed of volcanic rocks, now generally known as Huronian. These form most of the southern hills. That those rocks are truly volcanic Mr. Matthew has proved by a microscopic study of their structure. In the Carboniferous and Permian periods there is no trace of any volcanic activity, but the small areas of Triassic rocks occurring in New Brunswick have heavy trap dykes, and about half of Grand Manan is composed of Triassic trap. The periods of volcanic activity in New Brunswick are as follows: 1. Huronian - Southern New Brunswick and the northern watershed. 2. Silurian and early Devonian - Passamaquoddy Bay, Baie Verte, etc. 3. Sub-carboniferous - Borders of the central plain, Grand Lake, Blue Mountains of the Tobique. 4. Triassic - Quaco and Grand Manan. In Nova Scotia, the periods were about the same. Prince Edward Island affords no traces of volcanic rocks. In concluding Mr. Matthew described the granite of this province, and alluded to the great field there is in this province for the petrographic study of igneous rocks. Mr. Matthew received a hearty vote of thanks."

Gazette - May 8, 1895 The Natural History Society. - ..... The paper of the evening was by W.D. Matthew, and was entitled The Volcanic Rocks of the Maritime Provinces."

Codes: GEOL / IDX_Names: Geology - General;
Daily Sun - Aug. 1, 1896 Surface Geology of New Brunswick. - The geology survey of Canada has lately issued a report on the surface geology of eastern New Brunswick that is more than common interest. The report is the work of Robert Chalmers, a zealous worker in the Natural History society before he joined the survey. The report makes a book of 149 pages, has two maps and three plates. Some space is given to an account of the Bay of Fundy, its origin and its remarkable tides. Many things have been written about the tides of the bay, but Mr. Chalmers gives the best explanation of the phenomena that has yet appeared. The greatest tidal oscillation in any part occurs at Noel river in Cobequid bay, when at spring tides the rise is 53 feet. The bulk of the report is devoted to the facial geology of the district, and is full of interest for students of that science. The local glaciers which existed in this province during the closing part of the ice age are described, and a map shows their extent and direction of their flow. It is interesting to note that the most remarkable of these glaciers seems to have existed right here at the mouth of the St. John river. An interesting chapter is devoted to the salt marshes at the head of the bay. The closing chapter is devoted to the economic minerals."

N.B. Reporter - May 6, 1896 Prof. L.W. Bailey. - His Eminent Service To Science Recognized By Dalhousie College. - Among the scholars who received the honorary degree of doctor of laws at the recent convocation of Dalhousie was Dr. L.W. Bailey of the University of New Brunswick. In presenting for that honor Prof. MacGregor said:- I am instructed to present to you for the honorary degree of LL. D., Professor Loring Woart Bailey, Ph.D., F.R.S.C., Professor of Chemistry and Natural History in the University of New Brunswick, upon whom the senate wish to confer this degree in recognition of the eminent services he has rendered in the department of Geology and Natural History, especially in the Geology and Natural History of the maritime provinces. Professor Bailey's published contributions to knowledge in this department number upwards of 35 and it would be impossible therefore to mention them in detail. I may refer, however, to his Report on the mines and minerals of New Brunswick, his Observations on the geology of Southern New Brunswick, the Remarks on the age and relations of the metamorphic rocks in New Brunswick, prepared in collaboration with Mr. G.F. Matthews; his Report of explorations and surveys in portions of York and Carleton counties, New Brunswick, and his papers On geological contacts and ancient evasion in southern and central New Brunswick,' On the Silurian system of northern Maine, New Brunswick and Quebec, On the physiography and geology of Aroostook county, Maine, and On the surface geology of southwestern Nova Scotia. These papers I mention not as being his best, but in order to show in so far as mere tables can show, the extent of the scientific work, which, notwithstanding the arduous duties of the chair which he fills with great ability in the University of New Brunswick, he has been able to accomplish, I ask you, sir in the name of the senate to confer the degree of LL.D. upon Prof. Bailey."

S.J. Daily Sun - Aug. 13, 1897 and St. Croix Courier - Aug. 19, 1897 Prof. Bailey of Fredericton, says the Beacon, ison Deer Island seeking geological specimens for the provincial government. He has recently returned from a very pleasant trip to Grand Manan."

Gazette - Jan. 26, 1897 Natural History Society. - Dr. Geo. F. Matthew will deliver the second lecture of his elementary course this evening. Subject - Geology from a railway train."

Gazette - May 5, 1897 Natural History Society. - ... Dr. Geo. F. Matthew read a paper entitled A New Paleozoic Insect... The following additions to the museum were made. Miss Foulis silver medal, medallion, and snuff-box presented to Robert Foulis by Earl of Chatham in 1779..."

N.B. Reporter - Nov. 24, 1897 The Globe. - Dr. Bailey unfolded some of the geological mysteries of the earth's surface before the members of the Natural History Society last evening in the High School Building."

Gazette - Sep. 9, 1897 Eminent Geologists. - Dr. L.W. Bailey of the University of New Brunswick was in Woodstock on Monday to meet Prof. Williams of Yale University who is conducting a geological survey of Maine on behalf of the U.S. Government to report on the economical uses that are being made of such minerals as are found in New Brunswick."

St. Croix Courier - Sep. 23, 1897 W.M. Veazey, principal of the Maugerville superior school, has just received from the geological survey at Ottawa, through the offices of Hon. A.G. Blair, Sunbury's representative in parliament, a handsome set of Canadian mineral specimens for use in the school taught by him."

S.J. Globe - Aug. 6, 1898 Mr. W.J. Wilson, of the geological survey staff, Ottawa, arrived this afternoon to assist in the geological survey in field work and will be absent two months. Mr. Wilson will be remembered as a former member of the teaching staff of the High school in this city, and also when resident here as an active member of the Natural History

S.J. Globe - Aug. 19, 1898 Prof. Bailey and son, of Fredericton, started from Newcastle on Monday morning for the Northwest Miramichi on a geologic survey."
Dorchester Spectator Feb. 26, 1898 Mineral cabinet donated to Dorchester school...."

Codes: GEOL / IDX_Names: Geology - General;
Daily Telegraph - Jul. 19, 1898 Harvey Station. - Mr. R. Chalmers, of Ottawa, a government surveyor, has been here for a few days past, making a survey of the country in this vicinity."

Carleton Sentenil - Jun. 18, 1898 W.F. Best, for many years official analyst in St. John, has resigned his position to accept a situation as chemist with a syndicate having headquarters at Dawson City."

Woodstock Dispatch - Jun. 22, 1898 Going to Klondyke. - W.F. Best, the well known analytical chemist of St. John, has gone to Boston where he will meet a company by whom he has been engaged for a year, and will proceed to the Yukon country in their interests.- Ex. Mr. Best will be remembered as giving evidence in the Canovan murder trial."

Weekly Record Fri., May 13, 1898 Minerals to Kings County Natural History Society....."

Daily Sun - Oct. 17, 1898 Geological. - The Work Messrs. Chalmers and Wilson Have Been Doing in New Brunswick. - Robert Chalmers and W.J. Wilson of the geological survey ofCanada were in the city over Sunday, some little work in the neighborhood of Rothesay having demanded their attention. They have now about completed the survey work they had on hand for this season, which was connected with the surface geology of York and Carleton counties. The hill features in this district have been surveyed and marked, the forest delineated, the rods measured, and the levels taken. Mr. Wilson leaves this morning for his former home in Petersville, and in a few days will close up his part of the work and return to Ottawa. Mr. Chalmers will proceed to Belledune, where his family have spent the summer, and go thence to headquarters."

S.J. Globe - Sep. 13, 1898 Exhibition. - ...The Natural History Society shows a fine collection of minerals....."

S.J. Globe - Sep. 16, 1898 Exhibition. - ...The Natural History Society Exhibit: .... In two handsome cases the society exhibits a fine collection of minerals, ores and building stones....."

Semi-Weekly Telegraph - Aug. 30, 1899 A Mineral Map of New Brunswick. - The director of the geological survey department, Dr. Dawson, at Ottawa, has just had completed a map of New Brunswick on a scale of 10 statute mile to the inch, in which are embodied the principal mineral occurrences in this province. This map will be welcome by all who are interested in the development of the natural resources of this province. Coal, iron, manganese, antimony, copper, nickel, gypsum, Albertite, limestone, peat, petroleum, mineral paints, salt and other mineral springs, argentiferous galena, granite, grindstones, &c., &c. products of the earth's crust of economic value to man. This map, together with the accompanying report prepared by Dr. L.W. Bailey, of the University of New Brunswick from records in the geological department, can be obtained from that office for a nominal sum."

Daily Sun - Feb. 1, 1899 Last night Dr. G.F. Matthew gave a lecture at the Natural History rooms on Heat as a Factor in Geology. The action of the sun as the primary sources of heat was described. Volcanic action was spoken of at length, and in this connection a large drawing was exhibited showing the structure, size and height of Chamcook Mountain when it was an active volcano in Silurian times. The lecture was illustrated by numerous maps and specimens."

St. Croix Courier - Sep. 7, 1899 A mineral map of the province has just been completed by the Geological survey department at Ottawa. For a nominal sum, a copy of the map may be obtained on application to the department."

Gazette - Sep. 29, 1899 Geological Survey. - R. Chalmers of the Geological Survey staff Ottawa is at the Royal. He has been in the province some little time visiting many points in connection with the Geological Survey work."

S.J. Daily Sun - Jan. 23, 1900 Geo. F. Matthew, D.Sc., will deliver a lecture on The Brachiopods or Lamp Shells at the Natural History Society's rooms this evening."

Daily Sun - Jan. 24, 1900 Natural History Society. - At the Natural History Society last evening, Dr. Geo. F. Matthew delivered avery interesting lecture on the Brachiopodia, giving a detailed description of the neutremata, atremata, protremata and teleoremata. The speaker described the great importance of these animals to the geologist, as on account of their possessing a hard shell their fossil remains present well defined outlines of their original forms. The lecture, which was extremely instructive, was illustrated by numerous drawings and fossil and other specimens."

Codes: GEOL / IDX_Names: Geology - General;
S.J. Daily Sun - Jul. 19, 1900....... Speaking of such things, the Geological Survey made an excellent purchase when it obtained from W.J. Wilson, formerly of St. John, a collection made by him before he came here of fossils from the Fern Ledges at the Bay Shore. Dr. Ami made the selection from the assortment brought up by Mr. Wilson. From what was left Mr. Wilson has furnished to a university in Illinois a valuable collection, and this year he has made up two sets, one for the Smithsonian Institute at Washington, and one for the Kensington collection of the British Museum. We may suppose that the institutions at London and Washington got value for the respectable price they paid for their collection, but the selections made by Dr. Ami for the museum here must be a good deal better than either of the others. S.D.S."

S.J. Daily Sun - Jun. 20, 1900 and Woodstock Dispatch - Jun. 20, 1900 Prof. Bailey of the U.N.B. is working in this county on a geological survey. At present he has his headquarters at the Aberdeen. He expects to be in the neighborhood

S.J. Daily Sun - Apr. 15, 1901 W.J. Wilson, formerly principal of the Leinster Street school, St. John, has secured a permanent positionon the Geological and Natural History Survey of Canada, with an increase of salary. The Review congratulates Mr. Wilson on his deserved promotion. - Educational Review."

St. John Star - Jul. 8, 1901 Dr. G.F. Matthew left on Saturday for a two week's trip in Cape Breton, where he will study the geologic formations. He was accompanied by Miss Bessie Matthew."

St. John Star - Mar. 6, 1901 Dr. Robert Bell succeeds the late Dr. Dawson as director of the Canadian Geological Survey. He is a native of Toronto, and a son of the late Rev. Andrew Bell. He is a geologist of high repute."

St. Andrews Beacon - Mar. 7, 1901 Dr. G.M. Dawson, director of the geological survey of Canada, and one of the ablest scientists of the Dominion, died at Ottawa on Saturday night of capillary bronchitis, aged 51 years."

Weekly Record - Fri., May 10, 1901 Work upon the Canadian Geographical Survey will be actively prosecuted in the Maritime Provinces duringthe coming summer. Professor Bailey will continue his work in the southwest portion of New Brunswick; Dr. Hugh Fletcher, with Mr. McLeod and A. McKinnon, will be engaged in Annapolis, Kings and Cumberland counties, N.S.; Dr. G.F. Matthews will collect fossils at Bras d'Or, while E.R. Faribault will survey in Halifax, Lunenberg and

S.J. Star - Apr. 1, 1902At Grand Falls. - Amazing Phenomenon. - The Cataract Moves 100 Feet Downstream. - (Special to the Star). - Grand Falls, April 1. - The people of this locality were astonished this morning to find that during the night the face of the cataract of Grand Falls had been moved about 100 feet down stream. The only theory that can be advanced to account for this remarkable occurrence is that the rock forming the falls had never been part of the adjoining strata, but a detached boulder of gigantic size wedged in there during some tremendous convulsion of nature in ages long past; and that it has been gradually loosening and was last night forced by the tremendous pressure of the ice and logs a hundred feet farther down the gorge. Thousands of people are hurrying to the place from all the country round about, and further developments are awaited with great anxiety. The curtain of the new cataract forms a rainbow of marvellous beauty and brilliancy, the changing colors producing an effect such as no one who beholds it has ever before witnessed. Grand Falls will hereafter rank as one of the great wonders of the continent. Already the people are speculating upon the probable great influx of sight- seers, and it is probable a monster hotel will be erected close to the cataract. [As this is the first of April the Star has great pleasure in printing the above despatch]."

S.J. Star - Dec. 3, 1902 Natural History Society. - The regular monthly meeting of the Natural History Society of New Brunswick was held last evening, the president, Senator Ellis, in the chair, Mrs. deB. Carritte and Miss Alice Rising were elected associate members, and a number of donations consisting of periodicals and reports made to the society's library. Prof. L.W. Bailey, the lecturer of the evening, was introduced by President Ellis in a few appropriate remarks. Dr. Bailey's subject was the Tobique River and its Geology, a subject with which he has closely identified himself since his first visit to that region over forty years ago. Last evening he gave the results of his explorations of the past summer in company with Prof. Johnson of the chemical department of the geological survey. Dr. Bailey said that these results would make necessary a revision of the geology of these northern highlands. It has been supposed that they were pre- Cambrian, but accident has revealed their true origin; for he came upon conglomerates and sandstones underlying the felsites in ravines at the base of Mt. Teneriffe, and further search revealed the same formation in other hills. ..."

Weekly Record - Fri., Jun. 6, 1902 The recent volcanic eruptions in the West Indies has called attention to the fact that there is an extinct volcano in this province. Prof. Bailey of Frederictonsays: To state that within sight of the spire of our city churches are the remains of an old volcano, and that in some far off period of the past that volcano was pouring out its molten floods not into the valley of the St. John but into an inland sea which then included not only that valley but most of the interior of the province, usually awakens a smile of incredulity, but if one takes the trouble to spend a day around Currie Mountain, to note now some of the rock composing the latter has the same composition and the same columnar structure as that of Staffa or the Giant's Causeway, while other portions are hardly distinguishable from the cinders of our grate or the slags of our furnace, they will not be long, I think, in admitting that the assertion is not without foundation."

Codes: GEOL / IDX_Names: Geology - General;

St. Andrews Beacon - Aug. 6, 1903 Charlotte County Minerals. - Dr. Robert W. Ellis of the Geological Survey, is in the city today, returning from Charlotte county, where he has been investigating the general structure of the mineral deposit there. Dr.Ellis has spent the last six or seven weeks in this work and says he found the formations very interesting and of considerable value. He prefers making his report to the department before talking more particularly on the prospects. -

Woodstock Dispatch - Jun. 15, 1904 Prof. L.W. Bailey of the University of New Brunswick and his son, H.B. Bailey who are conducting a government geological survey spent Sunday with Mr. and Mrs. J.J. Bedell. They left on Monday for

Evening Times - Nov. 11, 1904 An Ottawa despatch says:- 'Members of the geographical survey were sorry to learn that the great collection of Canadian fossil remains of New Brunswick owned by Dr. George F. Matthew, and bought by William MacKenzie, had gone to the museum of Toronto University. The fact that the collection could be procured was brought to the attention of the survey, but action was not taken soon enough. The collection at the survey, although very comprehensive, needed the collection of Dr. Matthew to make it complete.'"

St. Croix Courier - Jun. 29, 1905 A survey party from Ottawa is locating the geological boundary between Charlotte and St. John counties down in Clarendon. A geological survey party, in charge of R.A.A. Johnson, went into camp near Moore's Mills yesterday and will spend some time investigating the possibilities of mineral deposits in that section."

St. Andrews Beacon - Feb. 15, 1906 A Talk on Grand Manan. - (Sun). - ..... Thegeological stratum of the island was shown in a report which was stated had been very kindly furnished by D.I.W. McLaughlin, who lives on the island, and whose family have for three generations served well its interests and exerted a most beneficent influence. From the report it seems that the island is in great part of volcanic origin, and in the trap rocks many valuable minerals, notably copper, iron, baryta, etc. are found. There was a company once formed, which commencedmining operations there and found most encouraging prospects, but for some reason the work was discontinued but it is certain the soil of the island covers a stratum of copper which only needs a little enterprise to develop."

St. Croix Courier - Feb. 22, 1906 Volcano in Charlotte. - Chamcook Mountain Made Great Noise and Sent Forth Smoke. -Bit It All Happened Nearly a Century Ago and the Hill Has Since Behaved Quite Decently. - In his interesting weekly review of old times in New Brunswick, published in the St. John Globe, Clarence Ward has the following concerning our own staid old Chamcook Mountain: 'If memory serves me, in one of Professor Ganong's papers he writes that in the northern part of the province there is a high hill on one portion of which the snow never lies, even in the severest winter weather. Whether from internal heat or other natural causes, the reason of the phenomenon is not known. In the paper of May 19, 1828, is an account of an apparently incipient volcanic eruption on Chamcook Mountain, in Charlotte county. The opinions of the observers are divided as to its nature, some not favoring the volcanic theory: St. Andrews, May 3, 1828. - Volcanic Eruption. - The following is a statement of what gave cause to the report of a volcanic eruption on Chamcook, (or perhaps commonly called Greenlaw's) mountain, in this vicinity on the 20th April. About 10 o'clock on that day, Dr. DeWolf, of this place was near the barn of Mr. D. Smith, when suddenly he heard a violent and alarming noise, like that of an earthquake, but not accompanied with any tremulation of the earth, and immediately afterwards a large quantity of smoke (but he could perceive no flame) was emitted from the mountain - probably half way up - and ascending about thirty feet, as Mrs. Smith, the wife of D. Smith, who was not at home, states, above the trees; Dr. DeWolf thinks scarcely so high, and this was repeated, at short intervals, three times. They were both much alarmed, and did not think it prudent to go towards the spot from whence the smoke ascended. But since that time a party of gentlemen from St. Andrews have explored the mountain, but could find no trace to cause the belief that it was a volcanic eruption; but so strong is the impression on Dr. DeWolf's mind that his opinion is unalterably fixed that it was so. The day was calm and cloudless. Our own opinion is that it was a whirlwind - and in this belief we are strengthened from the circumstances that on the same day, and near the same hour, about five hundred weight of paper which was drying at the Chamcook mills was carried into the air by a whirlwind and dispersed in all directions; some of it fell on the top of the mountain. It may be proper to add that in February last Solomon Brown, his wife and George Greenlaw, neighbors to D. Smith, declared in the most positive terms they saw a blaze emitted from the mountain, about a quarter of a mile from where Dr. DeWolf saw the smoke ascend, and that it was accompanied by a noise similar to that which the doctor says he heard.'"

North Shore Leader - Apr. 17, 1908 The Burial of Dr. Robt. Chalmers. - The remains of the late Dr. Robert Chalmers arrived at Belledune from Ottawa on the Maritime Express Monday morning for interment. Mr. Allister Chalmers, son of the deceased accompanied the remains. The funeral took place at two o'clock Monday afternoon. Rev, Jas. Wheeler, of St. Luke's church, Bathurst, officiated."

St. Andrews Beacon - Jul. 16, 1908 Carleton Co. Crystals. - George Mallory was in town Saturday night with one of the largest crystals ever seen in these parts. It is over six inches long, andabout 2 inches thick, sparkles like a diamond, and cuts glass just like a hot knife runs through butter. Mr. Mallory found the gem somewhere near Bloomfield, and is certain that in Carleton County there is a regular Kimberley, waiting for some person to discover it. - Woodstock Sentinel."

Codes: GEOL / IDX_Names: Geology - General;
North Shore Leader - Jun. 26, 1908 To Examine Mineral Deposits at Bathurst. - The Canadian Geological Survey will undertake this year an examination of the mineral deposits in the vicinity of Bathurst. Dr. G.A. Young of Ottawa will be in charge of the party, which will consist of six or more members. Although there has been in other years geological work done in New Brunswick it has never previously been conducted on such an extensive scale. The deposits of iron and manganese near Bathurst have attracted much attention during the past year in Canadian mining circles, and it is likely that this year's work will consist of the examinations and mapping of this mineral region. One of the members of the party will be J. Douglas Trueman of this city."

Kings County Record - Aug. 13, 1909 Thomas Jordan, Knightville, brought an interesting curiosity to the Record office this week inthe shape of a petrified branch, which was taken from a buried tree found on the farm of John S. Chambers, Knightville. The tree was only about half solidified, the wood on some of the branches being still in a well preserved state. The formation is sandstone and every line of the tree and the inner markings are well recorded in stone. Pieces of the tree have been scattered broadcast among friends of the finders. From its appearance the change from wood to stone has taken place within a comparatively short time."

Kings County Record - Oct. 29, 1909 Mr. Denis, of the Geological survey, Ottawa, has been in Sussex for some days past looking over mineraldeposits in this vicinity. Mr. Denis has been concerning himself very largely with manganese formationshereabouts. He has secured considerable data concerning these deposits."

St. Andrews Beacon - Sep. 9, 1909 Dr. Ami, of the geological department, Ottawa,was in town last week."

Daily Telegraph - Sep. 19, 1910 W.J. Wilson, of the geological department, Ottawa, is at the Royal. He has been at Minto collectingspecimens of fossil plants for the new Victoria museum at Ottawa. He reports having found that district very rich in fossils. He found many which, while perhaps not new to science, have not hitherto been seen in the museum of the department. Mr. Wilson will leave today for Cape Spencer, where he will remain for a few days."

Daily Telegraph - Sep. 19, 1910 Advice Cheap at $100 Per Day. - Dr. Wilson, of Mines Department, Says This Might Be So. - Poor Investments. - Advice of Expert Might Save Many from 'Buying a Hole in the Ground' Instead of Valuable CopperDeposits. - The Outlook for This Province Not Good. - Dr. Alfred W.G. Wilson, of the department of mines, Ottawa, is at the Royal. During the summer of 1909 and the present summer, he has been investigating the copper properties of the provinces of Quebec, Ontario, Nova Scotia and New Brunswick with a view of publishing a tabulated report on the copper resources of the dominion. Dr. Wilson has been for some time in this province and expects to be here about three weeks longer. He gave it as his opinion, judging from what he had already seen, that copper does not occur in New Brunswick in such quantities or richness as would make the exploitation of it a commercial success. There may be small pockets which are of excellent quality, but in these cases there is not enough ore in sight. He depreciated the idea of people investing their money to develop property except on the very best expert advice. A mining engineer would charge perhaps $100 a day, but the advice he could give might be the means of preventing people from spending their money to 'own a hole in the ground.'"

St. Andrews Beacon - Sep. 5, 1912 On Research Work. - Dr. L.W. Bailey has gone to Campbellton where he will start on a research trip of several weeks duration along the coast from Matapedia to Bathurst. His object is to secure information for the biological station in this province at St. Andrews concerning the diatoms and lower marine forms of animal life, especially the extent to which these form the food of fishes. Mr. Arthur Brown, a U.N.B. student of Chatham, is accompanying Dr. Bailey as his assistant on the trip. - Gleaner."

St. Croix Courier - Jun. 12, 1913 30 Years Ago. - Wallace Broad has resigned his commission on the Dominion geological survey and is nowengaged in business with the firm of E. Broad & Sons at Milltown."

Daily Telegraph - Jun. 17, 1913 Geological Survey Party Now On Job. - Contour Maps Prepared by Last Year's Party Will Soon Appear - To Make First Adequate Survey. - The geological survey party detailed for work in New Brunswick as told in the Telegraph arrived yesterday and will work in the vicinity of St. John. A.O. Hayes,who is in charge, said last evening that the work would be carried on as fast as possible. During last summer a topographical survey was made of this same district within a radius of 20 miles from the city and the maps drawn to the scale of one mile to the inch would soon be published. The maps would show the contours at intervals of twenty feet. Up to this time the only maps of this class in existence were made from data collected by Messrs. Bailey and Matthew and Ells, in 1871-79, and included the whole southern part of the New Brunswick. The geological formations in New Brunswick have been studied for years, but this is the first attempt to make an adequate survey."

St. Croix Courier - Jun. 29, 1916 W.F. Ganong .... and S.W. Kain, of St. John, willstart this week to explore the St. Croix between Vanceboro and St. Stephen, studying the geological and botanical features of that vicinity......"

Codes: GEOL / IDX_Names: Geology - General;
Kings County Record - Sep. 2, 1921 Prof. D.F. Ganong Examining Kings. - Is Investigating New Brunswick in Connection With His Book on New Brunswick Geology and Geography. - Among the distinguished visitors to Kings during the past few days was Dr. D.F. Ganong, of Smith's College, Northampton, Mass. He was accompanied by Mr. Walter Ganong, St. John. Prof. Ganong has been engaged in collecting data in connection with New Brunswick's geology and geography. The result of his labors will be embodied in his work on these subjects, so far as they apply to this province. Prof. Ganong, who is an author of many well known text books, has given much of his life to the preparation of the larger work, which will be the crowning achievement of a life which has been of material benefit to the world. During his work in this province, Dr. Ganong has visited much of the entire province. He has spent weeks in this, his native county, investigating its geological formations, its rivers, streams, and mountains. His present visit was in connection with some of the waters of the section. He was also a visitor to the Friar's Nose, where he investigated the formations there. Dr. Ganong returned to St. John on Monday. Later he will spend further time in Kings."

Carleton Sentinel - Jan. 16, 1925 Dr. L.W. Bailey, Many Years on the Faculty of the U.N.B., Dead. - The death occurred at an early hour Saturday morning at his home on University Ave., of Dr. Loring Woart Bailey, a well known citizen and professor emeritus of geology and natural science at the University of New Brunswick. He had been in failing health for some time but it was only a few days ago that his illness took a serious turn and members of his family living at a distance were summoned to his bedside. The end came peacefully shortly before one o'clock. Sketch of His Career. - Dr. Bailey was born at West Point Military Academy in New York in September 1839 where his father was the first professor of chemistry and mineralogy. His mother was Maria, daughter of Col. Slaughter, of Colpepper, Virginia. Dr. Bailey was a descendant of John Bailey, who came from Chippenham near Bristol, in England, in 1635. When quite a young man he was sent to the Episcopal College of St. James in Maryland of which he was the oldest graduate at the time of his death. In 1853 his mother and only sister perished on the burning steamer Henry Clay, in the Hudson and this tragedy shortened his father's life. A Harvard Graduate. - Dr. Bailey graduated from Harvard University with the degree of B.A. in 1859 and received the degree of M.A. from Harvard in 1861 in which year he was appointed professor of Natural Science at the University of New Brunswick to fill the place of Dr. James Robb who had died. Dr. Bailey received the degree of Ph.D. from U.N.B. in 1873 and at a subsequent date was granted the degree of L.L.D., honoris causas from Dalhousie University. In August, 1863, he was married in the Cathedral at Fredericton to Laurestine, only daughter of Joseph Marshall deBrett, Marechal, Baron d'Avary, Chevalier de St. Louis, a former superintendent of education in New Brunswick and professor of modern languages at the U.N.B. He is survived by his wife, four sons and two daughters. The sons were all with him at the time of his death. The sons are Joseph Whiteman, counsel at law of Boston; Loring W. Bailey Jr., of Quebec; Dr. George W. Bailey of Woodstock, medical inspector of schools, and Henry Bond Bailey of Fredericton. The daughters are Mrs. Harlem E. West and Miss Laurentine M. Bailey. Dr. Bailey was one of the charter members of the Royal Society of Canada which was established by the Marquis of Lorne in 1882 and regularly attended its meetings."

Codes: GEOL / IDX_Names: Geology - General;
Evening Times Globe - May. 12, 1928 Probe of N.B. Minerals To Be Conducted. - Start Made Today in Two Promising Ore

Sections of Province. - Steps have been taken for the incorporation of anexploration company, in which are interested the Huronian Belt Company and a group of prominent provincial men, to investigate the metallic mineral resources of New Brunswick. The venture has passed the preliminary stage of prospecting and W.M. Goodwin, engineer of the Huronian Belt Company, said Friday that he had ordered a start to be made today for further investigation of promising ore deposits. He did not care to say just at present where these operations were to be held. R.S. Dening, general manager of Huronian Belt and allied companies, arrived in the City on Friday morning after a visit to Halifax and was guest at a luncheon in the Union Club, tendered by R.B. Buchanan, manager of the Canadian Bank of Commerce, at which there was a general conference with local men of prominence. Mr. Dening left on the afternoon train for Toronto, Canadian headquarters. Dominion Wide Interests. - Mr. Dening, speaking to a Times-Globe reporter, said that his company were interested in mining developments throughout Canada and reports received from the Maritime Provinces were sufficiently interesting to have his engineers make preliminary surveys. These in turn were such that further explorations would be undertaken along modern lines. He stressed the fact that modern methods would be used to determine what mineral resources were to be found here capable of profitable commercial development. Old Country Concern. - The Huronian Belt Company is a London, England, concern that has carried on exploration in Canada since 1911 with great success. It was formed by F.H. Hamilton, who is head of one of the leading mining groups in the United Kingdom, which has successfully conducted mining operations in South Africa, Australia and Russia, as well as in the Dominion. Mr. Goodwin, Mr. Dening's engineer, who accompanied him here, said that Mr. Dening had finally authorized the formation of exploration companies in New Brunswick and Nova Scotia for the purpose of investigating thoroughly their metal mining possibilities after his engineers had advised him that the provinces offered a reasonable chance of success in this way, if subjected to modern investigation methods. Mr. Goodwin said that he had visited New Brunswick frequently within the last two years and had come to the conclusion that prospects in the line of mineral development were worth following up. Three Stages. - The work of making a mine might be logically divided into logical stages, he said. First there was the prospecting stage, when evidence of minerals was found on or near the surface. These are dug out and if indications still look promising more serious work is undertaken. This consists of blasting, digging trenches to uncover the deposit and the sinking of test pits. If this work warrants it, diamond drills are then used to test the lateral extent and depth from the surface. If indications by diamond drill tests are still favorable this is followed by the sinking of a shaft. If ore body is then brought up of economic dimensions and grade, operations are started on a large scale. To start this large phase of mining requires capital running into the hundreds of thousands and perhaps millions and can only be undertaken successfully by well organized companies, such as the Huronian Belt Co. capable of supplying the sums needed, he said. At this stage the mining property may be called a good risk and money put in considered a speculative investment. Mr. Goodwin said that the Huronian Belt Company had made its capital through successful mining ventures and the method's followed were those which had been gradually evolved within the past thirty years, so that engineers now worked along assured lines. Prior to that period prospecting was carried on by unqualified men. The company followed conservative procedure and was not willing to throw its money away, he stated."

Codes: GEOL / IDX_Names: Geology - General;
Kings County Record - Feb. 22, 1929 When Palm Trees Grew in Sussex Vale. - Mr. A.C. Gorham, Director of Elementary Agricultural Education for the Province of New Brunswick Writes Interestingly of a Piece of Petrified Palm or Fern Belonging to Some Geological Age. - One of those cold days when the temperature was away below, how far it doesn't matter, but Jim Robinson got out of his motor truck and handed me the stalk of a date palm or some kind of palm which he had found up along the brook on his farm. What you don't mean to tell me that palms or any kind of vegetation say nothing of tropical growth, could grow around here in this weather. No! No! It's a piece of petrified palm or fern belonging to some geological age; say, some millions of years ago. Millions! What do you know about millions of years? Nothing, I must confess, but the geologists tell me, and they are pretty good guessers, that it was probably fifty millions of years ago and that was some time before the Saxby Gale I reckon. Well, here's the piece of palm branch, looks like sandstone, might make a good scythe stone. No, it's rough with uniform rows of lumps and depressions. These are the modified leaves or scales. Every one of them is there just as perfect as can be. Oh, for those good old days. We could sit under the palms and bask in the warm tropical sunshine. Perhaps, but give me the good old summer time just as we have it today, since you say there were great mammoth creatures larger than elephants or some of those dinosaurs travelling up and down the streams and along the beaches reaching their long necks twenty or thirty feet for the fruit of the palms. What would we people do who are afraid of a hornet or a grass hopper or who have to arm themselves with double barrel shotguns against a rabbit or a deer. Well, but that is another story. How could such changes take place in the earth and climatic conditions? Being an observing person you, no doubt, have noted the effect of weathering of rocks, that is, the action of sun, rain, frost in wearing down the earth's crust. There is also the action of streams, underground waters, glaciers, winds and the ocean. All these work upon the earth from without, and all are set in motion by an energy external to the earth, namely, the radiant energy of the sun. Under the action of forces resident within the earth the crust slowly rises or sinks, from time to time it has been folded or broken; while vast quantities of molten rock have been pressed up into it from beneath and outpoured upon its surface. Each individual body of stratified rock, or formation, constitutes a record of the time when it was deposited. The structure and the character of the sediments of each formation tell whether the area was land or sea at the time when they were spread; and if the former, whether the land was river, plain or lake bed, or was covered with wind blown sands,or by the deposits of an ice sheet. Once upon a time as the geologists tell us, and they can give much evidence to substantiate their beliefs, the conditions here were tropical at another time this section of the world

was covered with ice in the form of glaciers. Evidence would show that these rivers of ice flowed from what we call the polar region towards the equator and the extent of this glacial drift reached a point south as far as Pennsylvania and reached almost across the continent in a more or less straight line. But let us get back under the palm trees and tropical ferns of Jim's farm. Probably these fossils belong to the carboniferous or coal age. The gloomy forests and dense undergrowths of the carboniferous jungles, would appear unfamiliar to us could we see them as they grew, and even a botanist would find many of their forms perplexing and hard to classify. None of our modern trees would meet the eye. Even mosses and grasses were still absent. Tree ferns lifted their crowns of feathery fronds high in the air on trunks of woody tissue; and lowly herbaceous ferns, some belonging to non-existing families, carpeted the ground. Two kinds of gigantic club moss of the coal period are named; Lepidodendron, or scale tree, and Sigillaria, or 'seal-tree.' This latter was similar to the Lepidodendron, but its fluted trunk divided into even fewer branches, and was dotted with vertical rows of leaf scars, like the impressions of a seal. These trees, thirty or forty feet in height, were anchored by means of great cable-like underground stems, which ran long distances through the marshy ground. Fossil stumps of these trees are common in coal measures. This early tropical climate may have been a comparatively more congenial one. Our science cannot fortell whether all traces of the Great Ice Age are to disappear, and the earth to enjoy again the genial climate of that early far away period or whether the present is an interglacial epoch and the northern lands are comparatively soon again to be

Telegraph Journal - Sep. 14, 1929 Mineralogist is Appointed For Province. - Dr. William J. Wright, of Bear River, N.S., Named by Government. - Dr. William J. Wright, of Bear River, N.S.,was appointed Provincial mineralogist at a meeting of the Provincial Government, held Friday night in the Government Building, Saint John. The appointment will go into effect on Oct. 1 The position has been standing vacant for some time and Hon. J.B.M. Baxter, K.C., L.L.D., Premier of the Province, said last night that the position had been finally filled satisfactorily, in the opinion of the Government."

Kings County Record - Aug. 29, 1930 Resources of New Brunswick. - ... Mineral Wealth Not Fully Surveyed. - Non-Metallic Products. - The mineral wealth of New Brunswick has not been fully surveyed. Heretofore, the non-metallic products - coal, gypsum, natural gas and oil, limestone, granite andsandstone have been the mainstay of the province's mineral output. In 1929, according to official figures, the total mineral production of New Brunswick was valued at $2,371,137, of which the greater part consisted of coal, natural gas and petroleum. There was also some production of gypsum, of grindstones and of clay products, mainly brick. There are indications in the province of copper, antimony, iron, lead and zinc, as well as salt and potash. Prospecting has become more active in recent years, owing, in part, at least, to improvements made in the mining laws of the province, and it is expected that the search for metallic ore bodies of

Kings County Record - Mar. 27, 1931 Provincial Geologist Addressed Luncheon Club. - A largely attended meeting of the Sussex Luncheon Club was held at the Depot House on Thursday of last week with Walter J. Mills in the chair. ... The speaker ofthe day was Dr. W.J. Wright, provincial geologist, who gave an interesting talk on the mineral possibilities of the province. The chairman voiced the appreciation of the club. Dr. Wright in his talk deplored the fact that New Brunswick people were not 'prospecting minded' enough and stated that in his opinion the future of the mineral wealth of the province depended upon non-metallic minerals such as coal, gypsum, salt, building stone, and so forth. Dr. Wright is professor of mineralogy at the University of New Brunswick and is also employed by the Provincial government to investigate mineral possibilities in the province. He has been thus employed for about one year. 'Providing the minerals are there, there is no reason not to have as great a mineral development as Ontario,' Dr. Wright said, but he urged that all prospects be fully investigated before extensive operations were undertaken. If there was a decent showing there would be no trouble in getting money for testing, he said. He spoke of the fine new laboratory which the Department of Lands and Mines had fitted up in Fredericton for the purpose of helping mining in the province and of conducting researches into mining prospects. Dr. Wright also dealt with the difficulty of prospecting in New Brunswick because of the 'drift' that in many parts was overlaying the stratified or other rock formations."

Kings County Record - May 6, 1948 Arnold McAllister Wins Scholarship. - Arnold L. McAllister, son of Mrs. Bessie L. and the late James E.McAllister, has been named a Beaverbrook Scholar for two years' study at the University of London, London, Eng. He was one of 12 New Brunswickers selected to proceed overseas. Mr. McAllister at present is attending McGill University, where he is studying for a degree of doctor of philosophy and lecturing in geology on the university staff. A graduate of Sussex High School in 1939, Mr. McAllister was class historian. He won a Beaverbrook Scholarship entitling him to four years of study at the University of New Brunswick and also an I.O.D.E. bursary. While attending the Fredericton university, Mr. McAllister was a brilliant student and took part in many extra curricular activities. He was a member of the university's hockey, rugby and track teams, and captained the hockey team. He won the Sir Frederick Williams Taylor Medal as the university's outstanding athlete in 1943. For three years he was a member of the Student Representative Council, serving as treasurer in his junior year and president in his senior year. He was a member of the managing board of the student publication, The Brunswickan, and also found time to win the Loring Woart Bailey Memorial prize of $100 for third-year geology students. Mr. McAllister served as a lieutenant in the university C.O.T.C., and after graduation in 1943 as class valedictorian he joined the Canadian Army as a lieutenant in the Royal Canadian Artillery, serving on the Pacific Coast. He served for a time after the war as acting associate professor of geology at U.N.B., leaving in September 1946, to enter McGill University as a student and join the lecturing staff of the Montreal institution."

Kings County Record - Sep. 11, 1952 Sussex Man Joins Faculty of U.N.B. - Dr. A.W. Trueman, president of the University of New Brunswick, has announced the appointment of two new faculty members in the department of geology. Dr. Arnold L. McAllister, formerly of Sussex, has been given the post of associate professor of geology, and Dr. S.J. Nelson, of Vancouver, B.C., becomes an assistant professor in the department, which is headed by Dr. Graham S. MacKenzie. Dr. McAllister is a graduate of the University of New Brunswick, having obtained his B.Sc. degree there in 1943. After serving as an officer in the Canadian army and teaching at U.N.B. in 1945-46 he entered McGill University, from which he graduated with the Ph.D. degree in 1950. Since leaving McGill he has been on the geological staff of the International Nickel Company. He has spent the present summer in Scotland engaged in special work for the company. Dr. McAllister's experience also includes field work with the Geological Survey of Canada and teaching at McGill as well as at U.N.B. As an undergraduate he was a first class student and active also in student affairs, serving a term as president of the Students Representative Council. He was holder of a Beaverbrook undergraduate scholarship, and was active in athletics."

St. Croix Courier - Jan. 21, 1954 Geology Head Of UNB To Speak At St. Andrews. - St. Andrews. - The Canadian Club of St. Andrews will have as speaker on Jan. 22 Dr. Graham S. MacKenzie, FRSC, head of the Department of Geology at the University of New Brunswick. The subject will be 'Recent Developments in Geological Research and Mining in New Brunswick', in which Dr. MacKenzie is particularly well versed as he has spent most of his summers since 1939 doing geological field work in this province for the NB Department of Lands and Mines, the Geological Survey of Canada and in two summers for private interests. Native of Toronto. - Dr. MacKenzie was born in Toronto but grew up and attended public school in Winnipeg and obtained his B.Sc. degree from the University of Manitoba. He then did post-graduate work at the University of Toronto attaining to his MA and PhD degrees. Dr. MacKenzie has done geological field work and mapping on mining properties in northern Manitoba, Ontario and Quebec, mostly for the respective governments. In 1937 Dr. MacKenzie turned his attention to the Province of New Brunswick, becoming a member of the staff at UNB, where he is now professor of Geology and head of the department. Dr. MacKenzie has the distinction of being a Fellow of the Royal Society of Canada and last fall was further honored with a DSc degree conferred by UNB in recognition of his outstanding achievements in his chosen field."

St. Croix Courier - Jan. 28, 1954 St. Andrews Club Hears Geologist. - St. Andrews. - Dr. Graham S. MacKenzie, FRSC, head of the Geology Department, University of New Brunswick, was the speaker at the St. Andrews Canadian Club Friday, Jan. 22, in the Parish Hall. Due to the absence of the president, the 1st vice-president, Mrs. Hermon Bartlett, took the chair ...... 'Recent Developments in Mining in NB' was the topic of Dr. MacKenzie's discourse. He first gave a general picture of the geological formation of the province, showing where the metallic deposits were found along a line from St. Stephen to Bathurst. He then outlined the various methods of ore body detection,electrical methods, diamond drilling, aerial maps and the air magnetic mapping. He explained why the lands around known strikes were so extensively staked and how the geophysical and geochemical explorations were carried out. He then gave a detailed account of the large pyrite deposits near Bathurst. As these deposits are developed he prophetized the gains to the province - the building of roads, docks, railroads with increased employment for New Brunswick people. ....."

Kings County Record - Sep. 9, 1954 Dr. G.S. McKenzie, head of the department of geology at the University of New Brunswick, will be the guest speaker at tonight's weekly dinner meeting of the Kiwanis Club of Sussex, in St. Paul's United Church Hall, starting at 6:15 o'clock. Dr. McKenzie will speak on mining developments in New Brunswick."

St. Croix Courier - Feb. 24, 1955 Mines Director To Speak To Canadian Clubs. - PHOTO of Dr. John Convey Guest speaker at a joint meeting of Women's Canadian clubs of St. Andrews and St. Stephen in the cafeteria of St. Stephen High School Monday evening March 7, will beDr. John Convey of Ottawa, director of the mines branch of the federal department of mines and technical surveys. His subject will be Canada's Metal Picture in a Jet and Atomic Age. Dr. Convey was born in England, coming to Canada in 1929. He took his M.Sc. at the University of Alberta and PhD. in atomic physics at the University of Toronto. After joining the RCN during World War II, he was sent on loan to the Royal Navy where he worked on radar and naval operational research. Following the war, he became associate professor of physics at the University of Toronto. In 1951, he was appointed director of the mines branch of the federal department of Mines and Technical Surveys. Dr. Convey has played an active part on research committees on two continents. He is author of various technical articles and papers, including the Past, Present and Future of Canadian Steel and the Story of Metals. He is member and fellow of various Canadian, American and British institutes of physics and metallurgy."

St. Croix Courier - Aug. 3, 1961 Grand Manan ...... in 1839, Dr. Abraham Gesner published his important geological report on Grand Manan. This report stated that the island consisted of two greatand widely different sections dividing it from end to end, the western part of the island being of volcanic origin and the eastern end of sedimentary rock. Because of its unique geological background, Grand Manan is rich in unusual spots of interest to visit and study. In Whale Cove, at the north eastern part of the island, there are strange layers of rocks known as the 'Seven Days' Work'. At Northern Head, at the extreme point, a detached mass of trap rock, rejoicing in the name of the 'Old Bishop', stands in advance. Carved by the elements in the huge rock opening known as 'Hole in the Wall', and there is Nature's thirty foot well called 'The Grotto'. At Fish Head the quartz contains dark green chlorite, a mineral used by the Indians in the early days for making pots and other vessels. Commonly it is known on the island as 'pipestone' because the Indians still use it for making their pipes."

St. Croix Courier - Sep. 14, 1961 Explore Island Resources. - ... This week the Island will be visited by Dr W.E. Hale, of the geology departments of the University of New Brunswick to assistwith shaping a study program relating to that field. He will tour the Island and be guest speaker at a meeting to be held in the High School under the sponsorship of the Board of Trade Thursday evening. The Island's unique geological formation first attracted scientific attention in 1838 when a survey was made by the province's first geologist, Dr. Abraham Gesner. The area is now considered to have more of the requirements for field instruction than any other place in the Maritimes."

St. Croix Courier - Sep. 21, 1961 Island Geology Unique. - Grand Manan. - At an Island resources meeting held here Thursday evening, Dr. W.E. Hale, of the University of New Brunswick geology department, said Grand Manan and the Bay of Fundy were of extreme interest in the study of the earth's surface. The Island, geologically, was unique in the Atlantic Provinces while the entire bay was unique in North America. He described the original formations, as science had reconstructed the phenomena, stating that the rock on the eastern side of Grand Manan was some of the oldest in the world. The western side, actually the greater land mass of the Island, was relatively new in scientific terms and the contact, or fault, where the two meet is one of the few such clear divisions readily available for study. The western formation is of volcanic origin but he described the eastern mass as a 'complex', a term used when very little can be definitely determined due to age. Grand Manan was the obvious place, he stressed, to establish a center, such as a museum, that could be used as a focal point for this study. Graduate students, interested in these materials could very well assist with the movement. He added that his department would be happy to cooperate in such an endeavour. Scale models could be reconstructed along with samples from the various rock strata. This in turn would aid later students, and amateur geologists, who come expressly for field trips. Since the citizens meeting was being sponsored by the Board of Trade, he said there were commercial possibilities that should be studied. There was usually copper present in large volcanic faults. Recent activity in drill tests on the Island had been carried out with an amazing lack of technical or scientific advice and had been tied to a 'promotion' deal. There should also be deposits of barite (barium sulphate) while White Head was virtually a solid block of quartzite containing good quantities of silica which has a commercial value. Amethysts, or gem stones, have been found on the Island and would naturally be in the vicinity of such rock formations. He cited profitable operations in this field being carried out in Nova Scotia. The Island could also supply large quantities of building stone, crushed stone for highway construction and other needs, and could also furnish quantities of ornamental stone though this was more difficult to produce. The provincial university might be able to assist the current movement with a study of Island resources, with market analysis, soil studies, and, as side products of these endeavours, sample or construct specimens for the proposed museum."

Kings County Record - Aug. 20, 1964 PHOTO. - caption. - Leslie R. Fyffe. Among the 15 New Brunswick students who have been announced as winners of Lord Beaverbrook undergraduate scholarships, which have the value of $3,000 and cover a university period not to exceed five years, are Leslie R. Fyffe, Corn Hill; ...... Mr. Fyffe has also been named the winner of a $400 scholarship awarded by the New Brunswick Command of the Royal Canadian Legion."

Codes: GEOL / EXPL / IDX_Names: Geology - General; Exploration - General;
Daily Telegraph - Jul. 14, 1864 Gold Discovered. - Several months ago we informed our readers that the Government had secured the services of Professor Hind, with a view to the prosecution of an exploration of the Geological structure of certain portions of the province. We are pleased to be able to state that the Prof.'s labors already give promise of great advantages to be gained by the public. Gloucester and Northumberland counties have been visited by the 4 Professor, and we are now in a position to state that gold has been discovered in Gloucester both in quartz and in washings.- On Monday last we were shown a specimen of gold bearing quartz which Professor Hind has brought with him. It shows veins of gold running through every part, and the gold itself seems to be of a very fine quality. The Professor has also brought with him several bits of pure gold which he took out of the sand, with no other mining implement than his bread-pan! No special search was made for these specimens of the precious metal. It is an undoubted fact that a group of rocks, known as the ""Quebec group"", extends across the province in different directions, but especially into Northumberland and Gloucester. This ""Quebec group"" is identical with the Allegheny range which is rich in the most valuable metals, including gold. It crops out also in Upper Canada. The great Lake Superior Copper mines, and all other rich Canadian mines are found in this group, including the gold diggings at Chaudiere. The ""drift"" from it is found to be exceedingly rich. The same formation crosses under the Bay of Fundy from New Brunswick and rises again near the Atlantic coast of Nova Scotia where gold has been found in such abundance. Under these circumstances, and in consideration of the fact that the existence of gold in Gloucester has been settled beyond question, the Government have instructed Professor Hind to make a more thorough survey of this group of rocks as developed between the Maine frontier and the Gulf of St. Lawrence. That gentleman will presently commence a rigid examination of the ""belt"" at three points, namely, between Fredericton and Prince William, at the Northwest Miramichi, and at the Southwest Miramichi. Professor Hind's opinion of the probable richness of this tract of country being fully confirmed by that of Sir William Logan, the distinguished Canadian geologist, we may expect to hear of ""something to our advantage"" in due season. At the same time it must not beforgotten that disappointments lie in the

path of every enterprise, and that the most fondly cherished hopes and anticipations may be suddenly and rudely shaken."

Codes: GEOL / EXPL / IDX_Names: Geology - General; Exploration - General;
Daily Telegraph - Jan. 22, 1874 Suggestions on Mining and Mining Schools in New Brunswick. - by Edward Jack. - As the products of our forests are annually decreasing so fast it would be well here to turn our attention to the development of some other source of industry, and as our country exhibits mineral veins and beds of apparently paying size, it would seem most proper that the public attention should be directed to these. The want of capital in this matter is not so much felt among us as the want of knowledge, and there are no branches of science which have made more rapid strides, and none of which we are more ignorant than those of mineralogy and metallurgy. As regards our want of practical knowledge, I may say that I know of no one among us capable of making an assay of an ordinary ore of iron, while in the adjoining Republic young men are being educated in these branches of learning in first-class institutions, where not only is the theory of mining and assaying taught, but also the practical part, by men of skill and experience. We, residing in a metalliferous country, on the sea board, with plenty of wood and coal at command, should no longer remain apathetic. Among the various institutions of America specially adapted to these studies, the school of Mines in connection with Columbia College, New York, will probably rank in the first class. The mining engineering graduate goes through a thorough course of mathematics, chemistry, metallurgy and assaying. He is required to travel and visit mining and smelting operations, and to write a dissertation embracing the solution of some mechanical, mining, or metallurgical problem assigned by the faculty of the school, and the degree is not conferred until the student is thoroughly taught the various branches necessary to render him competent to take charge of any mining works. Something of this kind should be supported by the Government of New Brunswick, or if our resources are not sufficient for the purpose then they should appoint a Provincial assayer and metallurgist, who should have a laboratory where ores and minerals could be assayed for any resident in the Province at a small charge, and who could examine any mineral veins or beds which he deemed worthy of investigation. His salary should be paid by the Government, while any fees he received would be paid into the Provincial Treasury. The various States of the Union have their assayers, and there is no reason why New Brunswick should not have hers. The mining committee of the House of Assembly are of no use in this matter; every year demonstrates this more forcibly. It is a self evident proposition that a number of individuals talking or writing about things of which they know nothing, can shed no light on the subject they are investigating. If they do attempt it they are for more apt to mislead than enlighten. I have in my view several very absurd and injurious mistakes made in this way, but refrain from mentioning them. During the past autumn in company with A.F. Wendt, Esq., mining engineer, of the School of Mines, Columbia College, I visited a number of beds of iron oreon the eastern side of the St. John, above the Becaguimec; one, at Glassville, we traced by the outcrop three-quarters of a mile. Wood in this locality is very abundant; limestone is also found in the vicinity. Iron ore is carried by rail in Wisconsin a distance of ?6 miles to the forests where it is smelted, and if this can be done in that State, there is no reason why it should not be done here, if the ore is of sufficiently good quality to warrant it and we know that even the Woodstock ore will make a good rail owing to the quantity of manganese that accompanies it. Some of the assays of the up river ore show as high as 48 per cent of metallic iron, and iron is made in the United States from ore yielding only 25 per cent. In order to determine the quality of ore, quantity of flux required, etc., the services of the chemist are indispensible, and, so far as I am aware, we have never had about our iron works any person skilled in this necessary branch, since for the aid of the iron smelter, chemistry is as necessary as geometry to the engineer. From what we saw on the St. John, I think it not improbable that spiegel iron may be made in New Brunswick. If such should be possible, an immensely profitable branch of industry would be opened up. In order to manufacture this class of iron a large percentage of manganese is required, and I may here mention that I had a stone of ore assayed last summer in London by the assayers in the Bank of England, which yielded 23 per cent of manganese and only showed 0.15 per cent of phosphorous. The amount of iron in the ore was very small, but this may have been, and probably was, the result of oxidation, as I took the stone from the surface of the bed where, no doubt, it had been for many years exposed to the action of the air and moisture. This country has been cursed by speculators in mines - men deficient in knowledge, whose only object was to obtain possession of some small veins of metal, organize a company, and sell out. Now if the province had some skilled man in its employ, these places could be visited by him and a trustworthy opinion had, which, if favorable, would give capitalists confidence to invest in the undertaking. As there are a number of young men among us who are desirous of making themselves acquainted with mining and metallurgy, I will now, through the columns of your valuable journal, make this offer to the Provincial Government. If they will set apart for this purpose 30,000 acres of ungranted Crown Lands, I will undertake to establish in this Province, a school for instruction in mining, metallurgy and assaying under skilled men; with such supervision as the Government may direct (the qualifications of such supervisor, however, not to depend on his belonging to any particular church). As these lands are notoriously badly managed and yield to the provincial revenue, only a paltry sum yearly, it would be to the public advantage that some such use should be

Daily Telegraph - Jan. 26, 1874 Mining and Metallurgy. - George Matthew, Esq., send us the following suggestions in reference to this subject:- I read with much interest the letter of Edward Jack, Esq., and an editorial on mining and mining schools, in your issue of Thursday last. There is much truth in what your correspondent says in reference to the utter neglect of such matters here, as for instance in the provision made for educating the youth of this city. There is a practical comment on it in one of your previous issues, where a table is givenof the salaries paid to school teachers in St.

John,under the provisions of the Free School Act. From this it appears that while a teacher of modern languages is retained at a salary of $1,000, and classical studies liberally provided for, no provision whatever appears to be made for the teaching of chemistry or other branches of natural science, studies which are certainly of as much importance, and as great practical value in the every day affairs of life as foreign languages are likely to be. In many branches of natural science no satisfactory teaching can be given without practical illustrations. For such a purpose the collections and apparatus in the possession of the Mechanics' Institute and Natural History Society would be very useful. These are now all in the Institute building, and the museums of these two bodies, if combined and properly arranged, would be an excellent means of object teaching, and form a museum that would be a credit to the city. If any such teaching is attempted, it should be thorough - the best of its kind procurable - and a properly qualified teacher should be sought, who could give lectures (if it should be only for three or six months) to the higher classes in the public schools. Were such a course of study established, it would, if properly recognized at the University, shorten the course of study required of those who wished to take degrees in that institution. Your correspondent appears to think that ""there is no one among us capable of making the assay of an ordinary ore."" He has surely overlooked the two gentlemen who are quite capable of performing such work, viz. Dr. Bailey, of Fredericton, and Dr. How, of Windsor. He is also fully within the truth when he speaks of the high standing of Columbia College School of Mines in New York. But the high rate of living in that city all exclude many from the Columbia College School. And there is, indeed, no need of our young men going there when we have such a promising school at home as that connected with McGill College. I was informed that two years ago there were a number of students from Nova Scotia attending it, but none from New Brunswick. Here also, the Local Government could, as you suggest, do a good work in education by providing scholarships at the schools in connection with McGill College, for, students who in their University courses at Fredericton showed a desire and aptitude for the profession of mining. I do not presume to suggest any method for such purposes, but Mr. Jack's offer to establish a school on 30,000 acres of wild land reminds one of the way in which a map to the adjoining state is studded with grants of institutions of learning, while our own province so far as I know, is a blank in this respect. Would not the income of 30,000 acres be better applied in the way suggested above than by establishing a school of mines here? The profession of mining and metallurgy is one upon which few will enter, and a school of mines poorly attended would be a costly toy to New Brunswick."

Daily Telegraph - Sep. 1, 1876 Charles Robb, (Late of the Canadian Geological Survey,) Civil, Mechanical and Mining Engineer. Patent Solicitor,(The International Patent Agency)22 St. John Street, Montreal. S.J. Daily Sun - May 5, 1881 Geological Map of New Brunswick. - The Geological Survey of Canada has lately issued a very excellent map of the southern section of New Brunswick, showing the location and distribution of the various geological formations of that part of the Province. This is also accompanied by some sections, the whole reflecting great credit on Dr. Bailey, Mr. G.F. Bailey and other geologists who have taken part. A large portion of St. John, Charlotte and Albert counties is embraced in the pre-Cambrian period, which being that of our oldest rock formations, is also that in which many ores of copper, lead, iron and other minerals occur. This map fills up a much needed gap in our information as to places in which various minerals and metalliferous ores occur, and will be a great assistance to mineralogists and explorers in their searches after valuable mineralogical deposits. The pre-Cambrian appears to be especially rich in ores of copper. Galena, or sulphide of lead, occasionally associated with silver, is also found in this district, noticeably in Charlotte county, near L'Etang. The situation of these ore deposits on the shores of the Bay of Fundy, and in near proximity to the coal beds of Nova Scotia, would seem an excellent locality for their exploration and reduction. The advances lately made in the State of Maine in mining and metallurgy will certainly direct the attention of mining capitalists to the mineral wealth of our shores, and the success of the one must shortly prove that of the other. Smelting and reduction works have been lately completed at Portland in the State of Maine, where ores of all descriptions are purchased or where they are worked on shares, or at so much per ton. Copper ores are taken by this company when they only yield as low as two per cent. of copper, provided there is 25 per cent. of sulphur present. In a small pamphlet issued by the State of Maine Assay Office this season, it is stated that it may be said in general that: A lead vein two inches thick and assaying 60 per cent. of lead and 150 ounces of silver will pay to work. A copper vein six inches thick and assaying 15 per cent will pay to work. A zinc vein ten inches thick and assaying 60 per cent. will pay to work. A gold vein one foot thick and assaying $10 per ton (free gold) will pay to work. While recognizing the benefits conferred on the country by the work of which we have been speaking, we can only regret that the Province should be so long without a complete geological map of its whole surface. This is a matter that should long ago have received the attention of the Provincial government. What is required is a map that should show the whole of the various geological formations; and on the margin descriptions of the soils covering these formations might be printed in small type, in the same manner as the descriptions which are given on the margin of the map just issued. Such a map should be of moderate size and in cheap form; and with the descriptions of soils annexed would form a valuable guide to farmers from abroad wishing to settle in the country. In these descriptions, if prepared by a person of intelligence and ability, there would be no attempts to mislead and the whole truth would be made manifest. It has been too much the case for our people to erroneously look upon the whole Province as being a good field for the

farmer. We have much land that should never be settled, and the sooner we make the distinction and draw the line between lands fit for farming and those unfit for that purpose, the quicker will we be able to satisfy the wants of the agriculturist from abroad who is desirous of becoming a resident of New Brunswick, and the better pleased will he be with his new home."

Daily Telegraph - Aug. 19, 1890 Our Mineral Deposits. - Mr. Edward Jack is of the Opinion That Chemical Analyses are Needed for Iron Ore. - Talking with Mr. Edward Jack, with reference to the mineral deposits of New Brunswick, he tells a Telegraph correspondent that inquiries are very frequently beingmade of him by persons abroad regarding the mineral wealth of the maritime provinces of late, especially regarding their iron ore deposits; that this week he has received a letter from a large Pittsburg company relative to this matter, in which, owing to want of information of practical character, he cannot reply in a manner which will convey the desired knowledge. He says that for a long time he has seen the need of the examination of our iron ore deposits by men who cannot only make all the needful chemical assays, but who can, and have actually themselves been engaged in the making of iron and had much experience in it. He says that the geological survey is doing first class work in regard to mineral and metalliferous deposits in Canada, but that in the matter of iron ore deposits, in order to attract capital, these must be examined by some mining engineer who is not only a chemist, but also a practical iron maker having a good standing among iron masters; that, having made the acquaintance of a gentleman who answered all of their conditions and who had been for 10 years engaged in the manufacture of pig iron in America, he caused an application to be made to the minister of the interior last winter for a small appropriation by the dominion government for the purpose of a summer's exploration of the iron deposits of New Brunswick and the shores of Nova Scotia by such a practical iron maker, but that assistance was denied, on the ground that such explorations were evidently in the interest and for the benefit of certain private individuals or compamies. The consideration of this subject is one which, he says, should receive the attention of the members of the dominion parliament for both Nova Scotia and New Brunswick, and that they should be asked to call the attention of the dominion government to this very important matter. Geologists he says cannot do this work of iron ore explorations; it must be practical iron miners and iron makers who must be also thoroughly educated men. He says that he is confident if the services of such men had been secured and proper examination made, the maritime provinces would no doubt have been long since an ore exporting country."

Daily Telegraph - Oct. 7, 1910 New Brunswick Copper. - To The Editor of The Telegraph: Sir: Tour issue of Sept. 26th contains a letter subscribed 'One Interested', taking up thechallenge thrown down by some 'Dr. Wilson' of the geological survey department, anent copper, etc., as a mineral resource of the province. I noticed Dr. Wilson's remarks as they appearedin The Telegraph and was very much disappointed about our province, taking it for granted, of course, that one in position of Dr. Wilson would know what he was talking about and further that he had thoroughly investigated the whole field of operation and that his findings would be final. I am sorry that 'one interested' did not sign his own name and I trust that he will not let his protest drop with a letter to the press, but that he will take the matter up with the department at Ottawa and if he has proofs to back his letter up. I think that an expert would be sent by the department to investigate these definite points. One who also has faith in his native province, New Brunswicker."

Morning Journal - Feb. 12, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (continued) : The currents must have been of vast force and long continuence to build up such enormous beds. Fully 10,000 feet in vertical depth to solid rock must have been washed away, for even the old limestones and granites of Portland, the most ancient beds in the Province were laid bare and we may even find large masses of these rocks, sometimes 3 or 4 feet in diameter, worn or rounded by the power which removed them. But this power decreased as time moved on. As we rise to the higher beds of the period we find that these currents became much less violent, the land which had been rising rapidly now became more stationary, though still falling and rising at short intervals. Of its actual extent at this period we know little, but from the occurrence of these conglomerates skirting both sides of the high ridges, which stretch from St. John eastward to Shepody Mountain, it seems probably that these ridges constitutea long and narrow island, occupying much of the presentcounties of St. John and Albert. In Nova Scotia the Cobequid Mountains formed a similar island or chain of islands while to the north and parallel in general direction, lay another narrow strip of land, now comprising the peninsula of Kingston. Still another, of even greater length, stretched through the present counties of York, Northumberland and Gloucester from the boundary of Maine to the Bay Chaleur. This land was probably but scantily covered with vegetation, which had been largely destroyed by the Devonian revolution, but the intervening shallow channels still teemed with life. Shells and corals grew in abundance and their remains, crowded together like modern oyster beds, constitute thenumerous and valuable limestone beds of this formation. Fishes, too were plenty, for many of the strata are filled with their remains. They seem to have been especially abundant about the Albert Mines, and it is to them principally, that we are to look for the origin of that highly valued and curious substance, the Albert coal. That the latter was once a fluid oil or petroleum, very similar to that so abundant in other portions of America is now almost universally believed, both on chemical and geological grounds. That it is of Lower Carboniferous and not of Devonian age is also certain, for, as we have seen, the rocks of the latter had been baked by an intense heat long before the Albert shales began to be deposited, a heat so intense that all volatile and combustible matter, such as petroleum, must have been completely driven off. Nor is there anything in those Devonian rocks from which the bitumen could have come. We can only look to the shales themselves

as the source of the Albertite, and no one who has seen those shales, crowded as they are with the remains of fishes, whose mere skeletons are now left to us, can doubt that it was largely from the decomposition of their soft bodies that the oily matter, now hardened by exposure, originally came. There is another substance abundant in the rocks of this formation, which, though less valuable than the Albertite, yet deserves a passing notice. I refer to the numerous bed of gypsum or plaster, not only extensively employed for moulding and casting, but so beneficial as a fertilizer to the soils with which they are naturally or intentionally mixed. The origin of this gypsum is somewhat uncertain but the supposition of Dr. Dawson, the distinguished geologist and author, is probably the true one, that they are the result of a chemical action caused by streams of sulphuric acid flowing from volcanoes beneath the sea, and coming into contact with previously formed beds of limestones, shells and corals. But I must not delay over theoretical and uncertain facts. That shells and corals, producing limestones, did actually exist in vast numbers in the seas which then covered nearly all the central portion of the Province is abundantly proved by their remains; that volcanoes also were still active as in earlier periods, is also evident from the effects which they every where produced. Indeed this period would seem to have been particularly remarkable for the number and intensity of its igneous outbursts. Around the entire central basin they seem to have formed a burning crown, and we may still mark the spots such as Hampstead, Inniskillen, Harvey and the Keswick, where the fiery ..?.. pored forth. These volcanic disturbances were probably accompanied by oscillations of level, as indicated by the shifting nature of the deposits then formed, but upon the whole the Province was rising, and gradually assuming its present level. The interior basins were becoming more and more shallow, the islands larger and more numerous. Island seas, by being shut off from communication with the ocean, were gradually converted into salt and then fresh-water lakes, and finally into marshes in which, favored by a warm tropical climate and abundant moisture, vegetation became luxuriant, while the land was again covered with a rich forest growth. This was the period of the true Coal formation. It was a period remarkable chiefly for the large extent of the continent then above the sea, as well as for the low and level character of that portion which had been so elevated. The disturbances which mark so grandly the close of the Devonian age in New Brunswick do not seem to have affected other portions of the continent to the same degree. Few elevated ridges existed anywhere. Even the Allegheny Mountains had not yet been raised for they include large beds of Coal, which at the time of their formation must have been near the sea level. Over the central basin of America, where through the earlier age was a vast coral-growing inland sea, there were now only wide expanses of low marshy land, with here and there an island, supporting, as in our modern tropics, dense forests and jungles. In these forests and jungles, where vegetation was so rank, only the lower forms of terrestrial life found sustenance. Not that the latter was scarce, for plants, the natural food of animals, were far more abundant even then than now, but the air was not suitable for their respiration. Carbonic acid, a gas incapable of supporting life was then present in quantities in the atmosphere. Insects, such as scorpions, locusts and beetles, with reptiles, constitute the life of the forest, while in the seas were fishes, allied to our modern sharks, as well as shells and corals. But there were no quadrupeds nor birds upon the land nor whales in the ocean, for these are warm-blooded animals and require a purer air to sustain their life. It was the part of the great Co..?.. to effect this work of purification, to remove from the atmosphere the poisonous gas, and converting it into another form, to store it away in the earth for the future wants of the human race. How perfectly this work was done may be appreciated when we think of the enormous extent of the coal beds which represent the carbon then removed by vegetation from the air. The extent of the United States coal fields is 130,000 square miles, that of Nova Scotia and New Brunswick, 18,000. The thickest of the beds varies, of course, very greatly. One immense bed in Pennsylvania is 23 feet thick, and another in Pictou, N.S., 37 feet!. Now it has been calculated that at least eight feet of vegetable matter was required to make 1 foot of ordinary bituminous coal, or 12 for one of anthracite. It follows then that at least 300 feet of plant remains must have accumulated on that one spot alone, and for every six pounds of that coal of carbonic acid must have been taken from the atmosphere, rendering the latter purer by that precise amount. It is not of a curious thought that, as we sit by our fires today, we are as it were basking in the sunshine of the old Carboniferous forests, warming ourselves by the heat, and cheering ourselves by the light, stored up for our use in the earth's early days? The vegetation by which these enormous accumulations were formed was of a very different character from any now existing. There were no palms in the Carboniferous forests, no oaks nor maples nor willows, nothing indeed resembling our wooden hardwood trees. The plains were without grass, and the swamps and 13 woods without moss. The principal trees were related to the pne family, yet different from them in many important particulars. They were of large size, trunks fifty or sixty feet in length being not uncommon, and with them were

Royal Gazette - Aug. 14, 1867 Cap. LVIII. An Act to ratify and confirm the incorporation of the East Albert Mining and Manufacturing Company. Passed 17th June 1867 Whereas pursuant to the terms and provisions of the Act of Assembly, intituled An Act relating to Corporations, James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, did on the second day of April in the year of our Lord one thousand eight hundred and sixty five, file in the office of the Provincial Secretary a Memorandum of Association for the incorporation of a Company to be styled ""The East Albert Mining and Manufacturing Company,"" for the purpose of mining coal, shale, asphalt, asphaltic rock, plaster or gypsum, and all other minerals whatsoever; and for raising, manufacturing and trading in oils and other illuminating and lubricating substances, and such other business as may be incident thereto, with a capital of three hundred thousand dollars, to be divided into three thousand shares of one hundred dollars each, and stating that the office or principal place of business will be established at Hillsborough, in the County of Albert; and whereas the Provincial Secretary did on the same day grant his certificate thereof in the terms required by the said Act, and did give notice in the Royal Gazette of the granting of such certificate, with the terms thereof; whereupon the said James Blight, John Wallace, William Wallace, John

Beatty, and Reverend James A. Smith, became and were a body corporate and politic by the name and style of ""The East Albert Mining and Manufacturing Company,"" for the purpose in the said certificate certified, and for such purpose had all the powers made incident to a Corporation by Act of Assembly; and whereas fifteen per cent of the proposed capital stock was paid in for the purposes of the Company within two years from the publication of such notice in the Royal Gazette; but the certificate of such payment having been made, was not filed in the office of the Provincial Secretary within two years from the publication of such certificate, as required by the said Act of Assembly;- Be it therefore enacted by the Governor, Legislative Council, and Assembly. - That notwithstanding 6 such noncompliance with the terms and provisions of the said Act, the said James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, their successors and assigns, are declared to be, from and after the publication of such notice, a body corporate and politic by the name of ""The East Albert Mining and Manufacturing Company,"" with all the rights, powers and privileges incident to a Corporation by Act of Assembly; and all acts done and to be done and performed by them, and all properties, rights, powers and privileges acquired or to be acquired by them, are and shall be valid, held, used and effectually to all intents and purposes as if the said certificate had been duly filed in the office of the Provincial Secretary, pursuant to the provisions of the the said Act of Assembly."

Codes: GYP / LEGI / IDX_Names: Gypsum; Legislation, etc.;
Royal Gazette - Feb. 18, 1817 An Act for the encouragement of the Trade of this Province in Plaister of Paris, otherwise called Gypsum. -Passed the 11th of March, 1816. Whereas the Trade in Plaister of Paris otherwise called Gypsum, which abounds in several parts of the Sea Coast in the Bay of Fundy, within the limits of this Province, might, under proper regulations be renderedbeneficial to the Inhabitants thereof and promote the maritime interests of the British Empire by the employment of the Vessels and Seamen requisite to carry on the same:- I. Be it enacted by the President Council and Assembly, That from and after the first day of May next, no Plaister of Paris, otherwise called Gypsum, which shall be laden or put aboard any Ship or vessel at any Port or Place within the limits of this Province to be transported from thence to any other Port or Place within or without the same limits, shall directly or indirectly be unladen or landed or put on shore at any other Port or Place within the limits of this Province except the harbor of the City of Saint John, and the Harbor of the Town of St. Andrews, nor at any other Port or Place in the United States of America Eastward of Boston in the State of Massachusetts, nor unladen or put aboard any American ship, vessel, boat or shallop of any description at any Port or Place Eastward of Boston aforesaid, under the Penalty of the forfeiture of every such Ship or Vessel from which any such Plaister of Paris, or Gypsum, shall be so unladen contrary to the provisions of this Act, together with her Boat, Tackle, Apparel and Furniture, to be seized and prosecuted in manner hereinafter mentioned. II. And be it further enacted, That no Plaister of Paris, or Gypsum, shall be laden or put on board any Ship or Vessel at any Port or Place within the limits of this Province to be transported from thence to any other Port or Place within or without the same limits, until Bond shall be given to His Majesty, at the Office of the Treasurer of this Province, or of his Deputy, at, or nearest to the Port or Place where such Plaister shall be intended to be so laden, by the Owner or Master of such Ship or Vessel, with one sufficient surety in a sum double the amount of the value of the Plaister so intended to be shipped, estimating each ton at twenty shillings with a condition to render the same void if the said Plaister or Gypsum so intended to be laden or put on board such Ship or Vessel, shall not directly or indirectly be unladen, or landed or put on shore at any other Port or Place within the limits of this Province, except the Harbor of the City of Saint John, and the Harbor of the Town of St. Andrews, nor at any other Port or Place in the United States of America, Eastward of Boston aforesaid, in the State of Massachusetts, nor unladen or put on board any Ship, Vessel, Boat or Shallop of any description at any Port or Place Eastward of Boston aforesaid, and the said Treasurer or his Deputy as aforesaid, shall forthwith upon the execution of such Bond give to the Master of Such Ship or Vessel a Certificate that such Bond as aforesaid has been given, which Certificate shall be kept by the said Master to be produced by him as occasion may afterwards require, and if any Plaister of Paris or Gypsum, shall be laden or put on board any Ship or Vessel at any Port or Place within the limits of this Province to be transported from thence to any other Port or Place within or without the same limits before such Bond as aforesaid shall be given, every such Ship or Vessel and the said Plaister so laden before such Bond given as aforesaid, together with her Boat, Tackle, Apparel and Furniture shall be forfeited, and shall and may be seized and prosecuted in manner hereinafter mentioned. III. And be it further enacted, That if any Ship or Vessel, on board which any Plaister of Paris or Gypsum shall be laden as aforesaid at any Port or Place within the limits of this Province, shall be afterwards found in any other place, not having such Certificate as aforesaid of such Bond as aforesaid having been given, every such Ship or Vessel and the said Plaister on board such Ship or Vessel, together with her Boat, Tackle, Apparel and Furniture shall be forfeited and shall and may be seized and prosecuted in manner hereinafter mentioned. IV. And be it further enacted, That any Bond given under and by virtue of this Act shall and may be cancelled by the said Treasurer or his Deputy as aforesaid at any time within Six Calendar months next after giving the same upon production of a Certificate from the Collector of the Customs of the Port, or from any British Consul or Vice Consul at or near such Place, that such Plaister was actually unladen from such Ship or Vessel at such Port or at a Place to the Westward of Boston aforesaid, and if the Plaister mentioned in such Bond shall have been unladen in the Harbor of the City of Saint John, or in the Harbor of the Town of St. Andrews, then and in such case upon the production of a Certificate from the said Treasurer or his Deputy as aforesaid, that such Plaister was actually unladen as last aforesaid. Provided always that in case of Shipwreck or loss at Sea, proof of the same to the satisfaction of the said Treasurer or his Deputy as aforesaid, shall be equivalent to any such Certificate as aforesaid. V. And be it further enacted, That for every Bond and Certificate hereinbefore required to be given as aforesaid, the said Treasurer or his Deputy as aforesaid shall be entitled to demand and receive the sum of ten shillings and no more. VI. And

be it further enacted, That it shall and may be lawful for the said Treasurer and his Deputies or either of them and they are hereby authorized and required to seize and take any Ship or Vessel and the Plaister on board, which shall be liable to forfeiture under this Act and to detain the same, and that information shall and may be thereupon made by His Majesty's Attorney General in the Supreme Court of this Province and proceedings had to condemnation and sale according to the course of the said Court, and upon such condemnation and sale thereof, shall be paid and applied as follows, that is to say - One moiety thereof, after deducting the costs and charges of prosecution to the Officer who shall seize the same, or to the Person who shall have given information, in consequence of which such seizure shall have been made and prosecuted as the Court before which such prosecution may be had shall adjudge, and the other moiety to the Treasurer of the Province for the use of the same. VII. And be it further enacted, That any Person or Persons producing or attempting to produce, or having at any time produced any false or fraudulent Certificate, Paper or Papers, Voucher or Vouchers, in order to cancel any Bond required by this Act, or in any manner to evade the true intent and meaning of this Act, such offender or offenders shall each and every one of them forfeit and pay the sum of one hundred pounds, to be recovered and applied in the same manner as is provided in and by the third Section of an Act made and passed in the Forty-seventh year of the Reign of His present Majesty, intitled, ""An Act for raising a Revenue in this Province."" VIII. And be it further enacted, That in all cases of hardship which may arise in the continuation of and carrying into execution the provisions of this Act, relief may be had by applying to the Governor or Commander in Chief for the time being who has hereby full power and authority with the advice of His Majesty's Council, to direct the release of any seizure made, or discontinue or stay any prosecutions for penalties which may have been or may be intended to be instituted upon such terms as he may deem equitable. IX. And be it further enacted, That this Act shall not be in force until similar and corresponding provisions as near as may be in all material respects, shall be made and enacted by some Act of the General Assembly of the Province of Nova Scotia to be made and passed for that purpose with regard to all Plaister of Paris, or Gypsum which shall be laden on board any Ship or Vessel within the limits of that Province, nor until such provisions shall be published and made known by Proclamation from the Governor or Commander in Chief of this Province for the time being, to be issued by and with the advice and consent of His Majesty's Council for that purpose. X. And be it further enacted, That this Act

Royal Gazette - May 27, 1874 CAP. LVI. An Act for the purpose of winding up the affairs of the Petitcodiac Mining and Manufacturing Company.Sec. Sec. 1. When property of Company 3. Conveyance of may be sold. property to be under 2. Sale of property, how made. seal of Company. 4. Proceeds of sale, how applied. Passed 8th April, 1874 Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. That when and so soon as parties owning in all two-thirds of the Stock of the Petitcodiac Mining and Manufacturing Company, shall request the Directors ..?.. the sale ..?.. and personal estate, mining leases, and all other the property and effects, rights and privileges of the Company, such request to be shewn by a document in writing, signed by such stockholders, or their agents duly authorized, the Directors, or a major part of them, may order such sale to be made. 2. Such sale shall be made under the direction of the President or such other person as the Directors shall appoint, and may be made of the whole property together, or in separate parcels, at private sale or public auction; and if at public auction, the Directors and stockholders are severally allowed to bid. 3. Any conveyance executed pursuant to such sale shall be under the seal of the Company, verified by the President's signature, and shall be sufficient for conveying and assuring to the purchaser the property and estates thereby expressed to be conveyed, free from any trusts to the stockholders; and the purchaser shall not be bound to enquire whether such sale was made pursuant to the request of the stockholders, nor responsible for the due application of the purchase money. 4. Upon such sale or sales being completed, the Directors shall forthwith realize the proceeds, and after the payment of the debts and liabilities of the Company, and defraying all the costs, charges and expenses of and incidental to winding up the affairs of the Company, including therein, if they shall think proper, a reasonable compensation to the President for his services therein, shall divide the remaining assets of the Company among the stockholders pro rata according to the amount of their stock; provided that no stockholder shall be entitled to receive any dividend unless he shall have paid all calls due upon his stock."

Royal Gazette - Mar. 22, 1854 Cap. II An Act to incorporate The Albert Manufacturing Company Section. Section. 1. Company incorporated 5. President and officers; with general powers. Supplementary and general 2. Capital; power to powers. increase; votes; payment 6. Shares to be personal of stock. property and assignable. 3. First meeting to organize.7. Liability for debts. 4. Annual meeting for choice 8. Forfeiture of Act, how of Directors. incurred. 9. Right of Way, how obtained. Passed 20th March, 1854. Whereas the Township of Hillsborough, in the county of Albert, possess advantageous situations for the 2 building of Mills for manufacturing Lumber, Plaster andother articles, and for quarrying Plaster, Lime Stone,Marble and Free Stone, and for Mining purposes: And whereas in order to procure the requisite capital, it is desirable to incorporate into a body politic and corporate such persons as may be willing to advance fundsfor such

undertaking; Be it therefore enacted by the Lieutenant Governor, Legislative Council and Assembly, as follows:- 1. That Calvin Tomkins, William H. Steeves, and Walter Tomkins, and their associates, successors and assigns, be and they are hereby erected into a Body Politic and Corporate, by the name of ""The Albert Manufacturing Company,"" and by that name shall have a common Seal, sue and be sued, plead and be impeded, answer and be answered unto, defend and be defended in all Courts and places whatever, and shall have power and authority to purchase, hold and enjoy lands, tenements and hereditaments, for them, and their successors and assigns, and all other powers and privileges now incident to a Corporation by Act of Assembly of this Province, for the purpose of building a Mill for manufacturing lumber, plaster and other articles, and trading in the said articles; quarrying plaster, lime stone, free stone, marble, and other building materials, and trading in the same, and conveying the same to market; opening and working mines, and transacting other business connected therewith; and constructing and making such rail roads or other description of roads as may be deemed necessary for the transportation of such articles from the quarries to the place of shipment; and also that they the said Company, or a majority of them, shall from time to time and at all times have full power and authority to constitute, ordain, make and establish such bye laws and ordinances as may be deemed necessary for the good rule and government of the said Corporation, provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes of this Province, and those in force within the same. 2. The capital stock of said Corporation shall be fifty thousand pounds current money of the Province of New Brunswick, with liberty to increase the same to the sum of one hundred thousand pounds, to be divided into shares of twenty five pounds each, to be paid in at such times and installments as the business of the said Company shall require; and every person who shall be the holder of one or more shares, shall be entitled to vote either in person or by proxy, having one vote for each share as aforesaid; and it shall be lawful for said Corporation to take lands, quarries, buildings, wharves, machinery, mining rights or privileges, in the place of money, in payment of any instalment or instalments due on any stock subscribed therein, at such valuation as a majority of all the subscribers shall fix, said payment 3 to become void if satisfaction titles or conveyances to the Corporation be not made at such a period as said Corporation may by any bye laws or vote direct after its organization. 3. The first meeting of the said Corporation shall be held at Hillsborough, in the County of Albert be called by William H. Steeves, or in case of his death, neglect, or refusal, by any two of the said Company, by giving notice in one or more Papers printed in the City of Saint John, in this Province, at least thirty days previous to such meeting, in order to organize the said Company, and for the purpose of establishing bye laws, and choosing such number of Directors as by the said bye laws may be prescribed; which Directors so chosen shall continue in office until the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present, or appearing by proxy, shall organize said Company, establish bye laws, and choose Directors of the said Company, by a majority of votes. 4. The shareholders shall meet annually at such time and place as may be appointed and regulated in and by the bye laws of said Company, at which meeting the shareholders present in person, or by proxy, may either continue in office the Directors before appointed, or any number of them, or may elect a new body of Directors to supply the place of those not continued in office; provided always, that the omission to meet shall work no forfeiture, but the shareholders may be afterwards called together for that purpose, by one or more of the Directors of the said Company for the time being, or by any three of the shareholders. 5. The Directors of the said Company, or a majority of them shall choose a President and such other officers as they may deem necessary, who shall hold their respective offices until others are chosen in their stead; and the Directors, or a majority of them, shall have full power and authority to manage the concerns of the said Corporation, subject to the bye laws thereof, and the regulations herein contained, may appoint and employ any agent or other persons by them deemed necessary, and may declare dividends of the profits according as the interests of the Company may admit or require; but no person shall be eligible as a Director unless such person is a stockholder, and over twenty one years of age; nor shall any sale or purchase of real estate be made by them, except by consent of two thirds of the stockholders, voting as provided in Section second. 6. The shares of capital stock in the said Corporation shall be deemed personal property, and each shareholder thereof shall be entitled to a certificate for the number of shares subscribed or held by him, which certificate shall be signed by the President and Clerk or 4 Secretary of the said Corporation and shall certify the property of such shareholder in the said shares; and the shares of the said Corporation shall be assignable in such manner and form as the bye laws may prescribe, and the assignee of any share or shares shall be a member and stockholder in the said Company; and whenever any shareholder shall assign or transfer all of his stock or shares in the said Corporation, he shall cease to be a member 7. The joint stock and property of the said Company shall alone be responsible for the debts and engagements of the same. 8. Provided always and be it enacted, that unless ten per cent. of the capital stock shall be paid in for the purposes of the Corporation, and a certificate of such payment, signed and verified on oath by the said Directors, or a majority of them, (which oath any Justice of the Peace is hereby authorized to administer), shall be filed in the Office of the Secretary of the Province before the expiration of three years after the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years. 9. And whereas also it may be necessary for the said Corporation to obtain a right of way for a rail road or other road, over the lands of other persons, from their quarries to their wharves or place of shipment; Be it therefore enacted that in case where the Corporation cannot amicably agree with any person or persons as to the value of, or damage done to his or their lands, by the making of any rail road or other road by the said Corporation, from their said quarries to their wharves or place of shipment, then it shall and may be lawful for the said Corporation to obtain from two Justices of the Peace for the County where the said lands may lie, an appointment in writing under their hands, of disinterested freeholders of said County who shall under oath to be adminstered by either of such Justices, appraise the fair value of the land to be appropriated for said rail road or other road, or the damages thereof, to the said party or parties over whose land the same may pass; and upon the payment by the said Corporation of the amount of such value or damages to said party or parties, or upon a legal tender of the same by the Corporation or their Attorney for that purpose appointed, it shall and may be lawful for the said Corporation, by their servants, agents, or hired men, without further notice, to constuct such rail road or other road, and to pass and repass over the same at all times and with such things and in such manner as they may think fit; provided that if the owner or owners of any such land required for the for the purpose of such rail road or other road, be absent out of this Province, or cannot be found therein, or be incapacitated by reason of insanity, infancy, 5 coverture, or other disability, to receive said money or a tender thereof, then payment

N.B. Courier - Sep. 30, 1837 LETTER III. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: Resuming the subject of my last letter, and the route from Petitcodiac River along the main road to Saint John,I found the road after leaving Holstead's Inn, to pass over a considerable hill called the Portage. The rocks of this hill are sandstone of the coal measures; and among them fossil Cacta Calamide and impressions of leaves are visible where the strata appear at the surface, which in general is covered with a meagre soil. The Portage is four miles long, and although narrow and uneven, is very pleasing on account of the pretty grooves on each side, and the thick clusters of birch and maple like festoons overhanging the way. From this place the waters of the Petitcodiac find their way into Chignecto channel; while those of the Kennebecasis take an opposite direction and escape into the River St. John. This elevation seems like a barrier set up between the two streams, notwithstanding some of their ultimate branches meet each other. Sussex Vale or Pleasant Valley (names applied tothe same place by many persons) is twenty miles in length, and averages perhaps, from one to two miles in breadth. Its course is nearly southwest, and it extends from the Portage to Lyon's Inn at the mouth of the Mill Stream. The hills on each side are of grey sandstone and conglomerate which not only affords a shelter from cold winds, but reflect much heat upon the lower grounds between them. New red sandstone occupies the principlepart of the valley. This rock is, however, covered at atmany points with beds of clay, sand, and gravel.Southward there is a tract of mountainous country evidently connected with the high lands already noticed, and like them is probably composed of primary and transition formations. A large salt spring flows from thered sandstone of Sussex Vale, which notwithstanding, it has been worked on a limited scale, has supplied considerable quantities of salt. There are similar springs a few miles northward, where the saliferous rock is accompanied with beds of gypsum and limestone, extending to Butternut Ridge. It is probable that a bed of rock salt might be discovered at this place, but its 7 distance from any navigable river, would render the transportation of the article too expensive to be profitable, and therefore the springs only possess the minor advantage of supplying the country near them. Almost the whole of Sussex Vale is in a state of agricultural improvement; the uplands are excellent, and the intervale affords abundant supplies of hay. Cultivated by an industrious population, the earth sends forth her richest rewards to the intelligent and active inhabitants. Near the Church there are some beautiful spots; the winding river with its intervale, studded with elms, and the deep valley skirted with snug farms, and embraced by a chain of hills, having here and there a lofty peak - the whitened cottage - the poplar-shaded mansion; all combine to strike the eye and prove the fertility of the district. After crossing the Bridge over the Kennebecasis at Roach's farm, the hill along the north side of the road is composed of conglomerate, which extends a number of miles without being covered with other deposits. This rock may be seen well at Lyon's farm, near Millstream bridge. It is of a coarse kind and composed principally of pebbles of quartz, firmly cemented together, argillaceous matter and oxide of iron. All the pebbles have been rounded and partially polished by attrition, and from the close resemblance they bear to pebbles found in the channels of rapid streams, or on the shores of the sea, in the absence of other causes producing similar effects, there can be little doubt, they have assumed their spherical figures from being rolled by the violence or after passing along the bed of some ancient river. The present compact texture of the rock has been produced by the nature of the cement, and the pressure it has sustained. Many curious enquiries might be instituted to ascertain from whence these pebbles came, but they would be attended with difficulty, and are foreign to my present purpose. At Mill Stream bridge the valley terminates, and the hills forming its sides approximate each other so nearly, that there is only sufficient room for the Kennebecasis to pass between them. The surface of the country now becomes uneven, and although not remarkable for fertility, supports a tolerable growth of cedar and spruce. From Lyon's on the Kennebecasis to Hammond River, the conglomerate form the hills on both banks of the former. A few good farms were observed on the road, notwithstanding the soil is much inferior to the marley covering of the new red sandstone. Viewed from a hill not far from Hammond River Bridge, there is a pretty landscape, on the side of the Kennebecasis, there is a singular opening through the hill resembling a rude gateway - through this opening the farms and cottages of a small village are seen in the distance, like the 8 furniture to a house when its door is unclosed. About six miles from the city of St. John, on the road to Hammond River, the primary rocks of the chain of high land already noticed, cross the road; after having formed a series of elevated peaks, and high table land. The granite extends in a southwest direction to the Nerepis, where it is equally remarkable for its mountainous character, and sublime scenery. This formation at the spot where it is examined, is about two miles wide, but from the appearance of the mountains at a distance it evidently often extended to the distance of ten or fifteen miles in breadth. The surface above the granite near the road is low, and the turnpike has been made over boulders of that rock, these appear white from having been exposed to the weather, and fires which have occasionally overrun this portion of the country. Connected with the granite I also observed a good syenite in which the crystals of hornblende and feldspar bear very equal proportions to each other; and both rocks would supply materials for building - the Romans used syenite - both in building and architecture. Several specimens of late and epidote were procured in a fissure of that rock, which at another place was found incrustedwith the green carbonate of copper. A circumstance of much importance, and one which I hope my time on some future occasion will allow me to examine more carefully. These rocks are immediately succeeded on their south-east side by an extensive formation of primary limestone that extends in a south-west direction along the high lands northward of St. John, across the river near the Indian House, until it reaches Musquash, where it is quarried for marble. The boundaries of this most useful formation are unexplored, and but little is known of its real value and interesting minerals it contains. I have never seen limestone more highly crystallized than this, where it approaches the plutonic rocks thus mentioned. At several places where it is in contact with the granite, the marble is extremely compact, sonorous, and composed of crystals highly splendant, and white as the snow that in winter mantles the hills. Receding from the crystalline rock, the limestone becomes less and less granular and compact, until it passes by insensible shades into the transition variety, in which scarcely a solitary crystal can be perceived. These circumstances afford strong evidence in favor of the hypothesis that many older deposits of limestone have been converted into crystalline marble, by the heat applied under great pressure which accompanied the eruption of granite mountain masses from beneath. The effects then produced on the superimposed strata differ widely from those exhibited in the secondary and tertiary strata, where different chemical combinations and great pressure without the aid of volcanic agency have effected consolidation, but were incapable of producing those 9 vitreous and regular forms found in the lower rocks. It is true, that to produce crystals of carbonate of lime by artificial means, defies the skill of the chemist, but how imperfect are his manipulations, and how inadequate are his apparatus, when compared with the vast laboratory of nature, from whence whole mountains are raised in a single night, or whole continents descend into the places provided for their reception. Whatever may have been the original sources from which this limestone has been derived, it is impossible to infer that it was produced by the decomposition of older rocks, as it bears no analogy with the formations placed beneath it. Nor is it probable as some have supposed, that all calcareous strata have their common origin in the exuvia and remains of testaceous animals. It seems more rational to suppose that the lime now forming so large a portion of the earth's crust, had an origin from the hand of nature, and has only been accumulating through the medium of water or by extensive tribes of submarine creatures to which it is indispensible to form their shelly tenements. It is also necessary for the support of the vegetable kingdom, and the large quantity entering into the bones of man and other animals, naturally leads us to the conclusion that its abundance in another instance of design and wisdom of one Great Benefactor. Several varieties of marble were found in this district, some of which will vie in beauty with any ever discovered in foreign countries. Among them is a pure white with green veins, resembling the Carrara marble. At one place green serpentine was observed penetrating the calcareous rock forming the perfect Verde Antico of the Italians. Buccia marble and other varieties might be procured and may be readily distinguished even on the surface by the practiced eye. These beautiful and valuable materials for buildings and statuary, will not remain many years in their present useless state - they will soon supply the demand of foreign markets, and enter into more general use throughout the Province. The country at this place has the peculiar uneven aspect of lime districts. I wandered far from the road in the hopes of finding the entrance to some Cave, where perchance the bones of the fossil mastodon and hyena might be found in one common receptacle but disappointment followed, although such a discovery may reward the toil of a future visit. The soil, wherever the rain has permitted it to remain on the rocks, is almost sterile in consequence of being surcharged with the carbonate of lime. Those who cultivate any part of it will do well to mix it with fine sand to neutralize its caustic properties. Approaching the city of Saint John, from the eastward, the transition limestone disappears, and graywacke slate, and slate, succeed it, forming the hard and substantial basis on which the town is built. And it is singular that the capital of Nova Scotia and this its 10 rival town should repose on rocks of the same kind. At St. John, the strata also run north and southwest at some places they are almost vertical, at others they dip in opposite directions; these circumstances and the fractured state of the rocks, shew how much they have been disturbed since they were originally formed. The slate contains a considerable quantity of sulphuret of iron, and often find scales of mica, the latter giving the rock a peculiar glistening appearance. The town is built on a very uneven surface, and in order to overcome this difficulty large sums of money have been expended in making level streets, which show that its active and industrious inhabitants, amidst their commercial engagements, and various objects of enterprise, are daily rendering the city more cleanly, healthy, and comfortable, while its local situation cannot fail to render it in time one of the most important ports in America. The limestone is predominant at a village called the Indian House, situate on the River St. John, and about a mile above its entrance. This is the starting post for steam boats on the river and a kind of storehouse for the vast quantities of lumber floated down the watery turnpike of the Province. The Falls just below the village, at low water, afford a wild and sublime spectacle. The accumulated waters of the extensive and deep river, with all its lakes and tributary branches, are here dashed through a narrow opening, and over a rudely inclined plain towards the sea. Interrupted by small Islands above, and compelled to pass over huge masses of rock, obstructing a passage less than a quarter of a mile wide, the river foaming and spouting with tremendous fury, seems to assume at making its exit a most tragical character, threatening with instant death any who may venture upon its troubled bosom. But, at half-tide the scene is changed; the ocean spreads its mantle over the thundering cataract, and flowing inwards through the narrow chasm, stills the noisy rapid, and apparently to oblige the inhabitants, allows them to pass even with large ships in safety. On the east side of the falls a perpendicular wall of limestone, a hundred feet high, offers resistance to the violence of the stream, but as the current is directed on this side, it is ever crumbling down, and the river is gradually making for itself a wider and easier passage to the sea. On the opposite shore the rock is principally greywacke which makes a kind of peninsula stretching into the river and forming a considerable ""cove"" above the dangerous rapid. The ingenuity of man ever awake is about to render this local peculiarity profitable. The ""Saint John Mills and Canal Company"" have expended a large sum in opening canal across this narrow neck of land whereby they will direct a sufficient 11 quantity of water from above the falls into an expensive dam built below them and obtain immense power. The work is intended to propel twenty-four saws, and is rapidly advancing towards completion. It is the most extensive establishment of the kind in the Province, and reflects great credit on J.D. Emery, Esquire, the Agent, and the Engineer, who are engaged in its construction. From the falls to Grand Bay, four miles distant, the river passes through a deep narrow and tortuous channel, opened through hills of marble and transition limestone. I was surprised to observe that the continued action of the current, frost, drifting ice and timber has produced so little effect in forming sloping banks upon its sides, which are scarcely indented, but dip in straight lines beneath the water. When the absence of these effects, the narrow and remarkable outlet of the river, with its foaming cascade are considered, it appears probable that this site is by no means the original outlet of the Saint John, but one which has been reproduced from some geological catastrophe of which the rocks themselves bear the most unequivocal testimony. From what has already been observed I am induced to believe that the waters of this extensive river now escape into the ocean through an unnatural channel, and that its former bed was filled up by the same change in the level

Daily Telegraph - Jul. 16, 1867 Late Geological Facts. - Thirty-two years ago the Charles Lyell ...?... Some ancient sea marks on the coast of Sweden, and concluded there from that the land of Sweden was rising gradually at the rate of three feet ina century. The Earl of Selkirk has recently examined the same marks, and comes to an opposite conclusion which he has just communicated to the Geological Society. The change in the position of the marks he regards as apparent only, due to fluctuations in the level of the water, and not to any upward movement of the land. The question thus opened is important. Perhaps other geologists will take it up, and carry it on to a satisfactory conclusion. Among other geological factsworth notice is the demonstration that gold exists in the gravel of the river valleys of Central New Brunswick, as reported by Mr. Shea; and the surprising yield from a copper mine in Newfoundland..."

Codes: H6 / LEGI / IDX_Names: Albert County Copper; Legislation, etc.;
Royal Gazette - Jun. 4, 1862 Cap. LXVII. An Act to incorporate the Alma Copper Mining Company. Section. Section. 1. Company incorporated. 6. Capital stock liable 2. First meeting, when held. for any call. 3. Capital stock. 7. How sale shall be 4. Liability of shareholder. made. 5. Joint stock alone liable 8. Act void unless 25 for debts. per cent be subscribed, and 10 per cent paid within one year. Passed 23rd April 1862. Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. That A. Edwin Botsford, Oliver Barberie, William Sbenton, Alexander Wright, and Thomas Dasey, and their associates, successors and assigns, shall be and are hereby declared to be a body corporate and politic, by the name of ""The Alma Copper Mining Company,"" and by that name shall have all the general powers and privileges made incident to a Corporation by Act of Assembly of the this Province, for the purpose of mining and smelting copper ore, and for erecting the necessary works and machinery therewith connected, and for carrying on such other business as may be incident thereto. 2. The first meeting of said Corporation shall be held at such time and place in this Province as may be appointed by a majority of the above named persons. 3 3. The capital stock of the said Company shall be ten thousand dollars, divided into two thousand five hundred shares of four dollars each. 4. Each and every shareholder in said Corporation shall be held liable to the said Corporation for each and every call or assessment made, not however to exceed in amount the stock subscribed by him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, for the purposes of, or to carry on the operations for which the said Company is incorporated; which call or assessment may be sued for and recovered in any Court of Record within the Province. 5. That the joint stock and property alone of the said Corporation shall be responsible for the debts and engagements of the same. 6. The capital stock held by any shareholder in the said Company at the time of making any call or assessment thereon, shall be liable to the payment thereof; and in case of non-payment of such call or assessment at the time when the same shall be made payable, the Directors are authorized to order a sale to be made of so many of the said shares as they may think necessary for the payment thereof, with interest and expenses. 7. Such sale shall be made at auction, upon not less than thirty days' notice by the President, in some newspaper published in the City of Saint John, and the stock shall be transferred by the President and Secretary to the purchaser, who shall thereupon be entitled to a new certificate thereof; and the proceeds of such sale shall be applied towards paying the amount of such call or assessment with interest, and the costs, charges and expenses of such notice, sale, and transfer, and the residue (if any) to the former owner. 8. Unless twenty five per cent of the capital stock shall be subscribed, and unless ten per cent of the capital stock shall have been paid up for the purposes thereof, and a certificate verified on oath by the Secretary or Treasurer, or the Directors or a majority of them, (which oath any Justice of the Peace is authorized to administer), shall be filed in the office of the Secretary of the Province within one year from the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation shall terminate."

Royal Gazette - Apr. 22, 1863 Passed 21st April: An Act to amend the Act to incorporate the Alma Copper Mining

S.J. Daily Globe - Apr. 22, 1863 Alma Copper Mining Company incorporation amended."

Royal Gazette - May 20, 1863 Cap. XLVI. An Act to amend the Act to incorporate the Alma Copper Mining Company. Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly,- That the Corporation created by the Act of twenty fifth Victoria, Chapter 67, intituled An Act to incorporate the Alma Copper Mining Company, shall, when necessary, have power to extend the capital stock of the said Company to the sum of one hundred thousand dollars; and shall have power to increase the number of shares accordingly, or assess such increase upon the original shares, with the consent of the shareholders."

Moncton Transcript - Aug. 25, 1893 Contested Mining Leases. - Two cases heard before Surveyor General Yesterday. - Surveyor General Tweedie arrived in this city by yesterday afternoon's accommodation from North to hold examination into two contested cases of mining leases. The meeting was held in the Brunswick House and the evidence in the two cases taken. The lands of one were situated at Dorchester, Westmorland, and the other was at Edgett's Landing, inAlbert Co. In the first case applications were made by Thos. Caldwell and others for prospecting licences on a large number of areas upon which areas old mining operations had been carried on by Messrs. Eaton and Jewett, of Massachusetts. The latter parties claimed to have purchased all the mines and minerals from one Chapman, of Dorchester. At the date of the mining operations of Messrs. Eaton and Jewett, they were aliens and the question largely hinges on this point. Messrs. Tweed, Hanington & Hewson appeared for Messrs. Eaton & Jewett, and Mr. A.L. Robinson for Thos. Caldwell and others. All the evidence in the case is in and the Surveyor General will give his decision in a few days. In the other case at Edgett's Landing thecontesting parties were Messrs. V.C. and C.V. King, of New York and Miles Peck of Hillsboro. The Kings twenty- two years ago were carrying on large operations on this property, but abandoned it after one year. Miles Peck's father was their agent and died some three years ago. Miles Peck claims that as he paid taxes on the land and is in possession that the mining leases should issue to him. Mr. C.A. Peck appears for Miles Peck, who claims that the mortgage given by Miles Peck to the Kings is by limitation of time null and void. J. Howe Dickson, of Hopewell Cape, appears for Messrs. King and both parties have filed applications under the mining act for licences. The surveyor general heard all the evidence in the case and will decide the matter in a few days."

Daily Telegraph - May 4, 1881 Natural History Society. - ... presented the Society with the Report of Progress for 1879-80, and several Geological maps of the southern part of the Province. Dr. L.C. Allison then delivered an address on Diatoms. He remarked on the abundance of these curious minute organisms in the vicinity of St. John, and the interest he had taken in their study for many years. Diatoms occur both as marine and fresh water forms. It was long a doubtful question whether they belonged to the animal or vegetable kingdom, but the latest researches have placed them in the latter, and they are nowrecognized as a sub-class of the Algae. In size these organisms vary from one two-hundredth to one one-thousandth of an inch in length. They are symmetrical in structure, and consist of simple cells composed partly of silicious or flinty matter, and partly of a mucilaginous or jelly-like substance, which is almost wholly protoplasm. They are various shapes, some being circular resembling a pill-box, as the doctor described them, while others are long and narrow, tapering to a point at both ends; but there are various intermediate forms, many of them very beautiful, as seen under the microscope. Their motion (for it appears they have the power of propelling themselves in the water, a fact which led early observers to suspect they were animals) is supposed to be caused by their sucking in water at one end and ejecting it at the other. They are found on seaweeds along our shores and in ponds and lakes, in the floating vegetable matter which is seen around their borders. When dead their silicious portion often forms alluvial deposits, or is more generally known as infusorial earth. Geologically, they occur as far back as the cretaceous or chalk formation and from that period up to the present forming considerable areas or beds in certain localities. The city of Richmond, Virginia, stands on a deposit of this kind. When consolidated into rock, whetstones, etc., are made from it. The lecture, which was a very interesting one, was illustrated by a number of specimens, which the doctor exhibited through microscopes. Mr. G.F. Matthew also showed specimens of siliceous earth, consisting largely of diatoms from Lawlor's Lake and other places, and spoke of its economic importance, stating that it was used in the preparation of soap and also as a polishing material. A hearty vote of thanks was tendered Dr. Allison and Mr. Matthew at the close of the meeting."

Salt/Potash - Sussex Area; Mineral Springs;
Moncton Daily Transcript - Apr. 11, 1890 District Geology. - Mr. Chalmer's Work in Westmorland and Adjoining Counties. - The latest report of the Department of the Interior states that Mr. Chalmers, of the Geological Survey, was engaged during

the summer in studying the superficial deposits of southern New Brunswick, including the counties of Kings, Albert and Westmorland. The survey of the surface geology of this area is now completed, at least so far as the nature of the country will admit of such being done in detail. Considerable portions are still unsettled and in a wilderness state, and in these of course, the study andmapping of the surface deposits could only be done in avery general way. Maps and reports with reference to thisdistrict are being prepared. Mr. Chalmers further reportsas follows: The glaciation of the eastern part of the area in which lies the north eastern extension of the ridge or plateau bordering the Bay of Fundy, was investigated with some care, and facts of much interest discovered. This ridge forms a prominent feature in the landscape, being higher than any other part of the country except the northwestern highlands or the Gaspe Peninsula. Here, therefore, we might naturally expect to find traces of a continental glacier, if such ever swept over the eastern part of New Brunswick. None were observed, however; on the contrary, great masses of decayed rock in situ encumber its northern and northwestern flanks, while along the valleys of rivers descending from it northwardly into the Petitcodiac striae were found clearly indicating northerly ice movements. Along the Petitcodiac valley, however, which lies below the 200 feet contour line striae were seen to follow its course, showing ice movements in an easterly direction. It is evident that local glaciers and icebergs were amply sufficient to produce all these phenomena. On the summit of the Bay of Fundy ridge or plateau referred to, local areas which served as gathering grounds for glaciers sent some of these off towards the Bay of Fundy. A large number of facts relating to the glaciation of this district will be given in the annual report. District Mineral Resources. - In the enumeration of the mineral resources of this section, Mr. Chalmer's report says that brine springs are found at Sussex, at Salina, on Salt Springs Creek, and at Bennet's Brook, near Petitcodiac. At Bennett's Brook nothing has been done to utilize the springs there, to his knowledge. In all these places the brine contains a considerable percentage of sulphate of lime or gypsum. There appears to be less, however, in that of the Sussex springs than at Salina or Bennett's Brook. Medicinal springs are met with at Apohaqui and at Havelock Corner, Kings Co. The Havelock mineral water has, for some years, held a local reputation as a remedy for certain diseases; and as an extensive deposit of mud surrounds the spring, it might be utilized for the establishment of mud baths, which are said to be beneficial in the treatment of some diseases. Infusorial earth has been reported at Pollett River, Kings Co. Subsidence of the marshes. - Mr. Chalmers further says: I visited the Ship Railway now under construction across the Isthmus of Chignecto. In an excavation which is being made for the docks in the salt marsh at its western end, the following series of deposits is disclosed;- (1) marsh mud, 5 to 10 feet; (2) fine grained, stratified blue clay, holding numerous shells - thickness, from a few inches at one end to five to eight feet at the other; (3) peat or humus, six to fifteen feet thick, containing roots and stumps of small trees, chiefly haematae, and in some places portions of the stems. This peat or forest bed evidently grew on a sloping bank at the border of a lagoon or quiet inlet. The lowest part of it is now twenty feet or upwards below the level of high tides in the Bay of Fundy. At Aulac station, Intercolonial Railway, which is on the great Tantramar salt marsh, a boring 305 feet deep, was put down under the direction of P.S. Archibald, chief engineer, Intercolonial Railway. This boring shows likewise (1) marsh mud, eighty feet; (2) turf and bog; (3) red clay, &c. These facts clearly establish the conclusion that a subsidence has taken place here since the growth of the peat beds, and confirm the observations made previously by Sir J.W. Dawson."

Daily Telegraph - Feb. 8, 1883 New Brunswick Minerals. - Favorable Impressions of Mr. Symes. - Result of his Observations in Westmorland, Albert, Kent and other counties. - A member of the Telegraph staff, falling in with Mr. E. Symes, and conversing on his impressions of the province, diverged from agriculture into mining, Mr. Symes expressing higher opinions of our mining resources than are generally entertained. As he has travelled a great deal and given attention to the subject, the Telegraph representative was glad to hear his views. They can be inferred from the general scope of the interview. In your observations on mining, Mr. Symes, what portions of New Brunswick have you visited? The greater portion of Westmorland, Albert, Kent, a part of Kings, Queens and Sunbury, St. John and the North Shore counties. Was the object of your visit to examine the agricultural resources of those counties? Partly so, and partly to find out the general condition of the country. Also to make observations as to its geological formation and the probability of the existence of minerals of economic value. You are then, interested in minerals? I am. During the last summer I have been endeavoring to find coal suitable for the manufacture of coke. In this I was acting in the interest of some firms in England who wished information on that point. I was not successful in finding any during last autumn, but I am of the opinion that if I can spend a few months next summer, I will find a few beds, as favorable indications are observable. Are the indications such as lead you to hope to find coal in sufficient quantity to pay for working? I believe so, as I have already found several small seams ranging from 1 to 2 feet in thickness at no very great distance from the surface, and the indications are that at a few hundred feet thick seams would be struck. Do you speak now only of bituminous coal? Certainly, and apparently, judging from specimens, bituminous coal of good quality and remarkably free from sulphur. There are indications of anthracite, and I am strongly of opinion that a vein of this coal stretches across the Province. It would probably be found fully 700 or 800 feet below the surface. At what depth can anthracite coal be profitable? I believe in Pennsylvania beds are worked at a depth of several thousand feet. The deepest coal mines in the world are in Westphalia.

They are, I believe, over 3,000 feet deep. The Pictou mines, I am told, come next in depth. What is your opinion of Grand Lake coal? I don't consider it of extra quality, but I attribute that to the fact that it is ruined near the surface. There is probably plenty of coal in Queens, of good quality, which only needs capital and enterprise to develop it. A good investment might be made there by provincial capitalists in exploring the district very thoroughly. Do you know anything about Albertite coal? I think it was once a liquid, and in that respect it differs from other coal. It is a solidified oil, and was probably thrown up into pockets by volcanic eruptions. My opinion is based upon experience gathered in Galicia and Bukowina, Austria, in searching for oil, erdwax and ozekarate. The latter two are oil in a semi- solid state, and forms the crust around the pockets or springs where oil is formed. They exist, though in a less solidified form, in Pennsylvania. I think the indications promise further valuable discoveries in Albertite. Did you notice indications of oil? Yes; both in Westmorland and Cumberland. I bored in both places and only stopped for want of a little capital. Oil oozed up along the boring rods until I collected several bottles full. In Cumberland I tapped the side of a hill for eight or ten feet, and by the next morning I had collected a saucerful of quite pure oil, which dropped from the hole. The indications occur there which are found where oil is profitably worked. Would you state, shortly, what they are? The presence of saline springs, which would seem to show the presence of rock salt underneath. In Europe, when explorers want to find oil, they look for salt first; and when the salt is found, they bore for the oil, which is invariably found in the hard rock underneath the salt. Secondly, the existence of black rotten rock, to use the common term. This is always found near oil, and its peculiar character is due to the presence of oil. These are the principal indications, and they are both found in Cumberland and Westmorland. Are erdwax and ozekarate of commercial value? Yes, of high value. The first is a hard substance of brownish-black color resembling Albert coal, and from it some of the highest grades of oil are extracted. The residue, after the oil is extracted, forms the ozekarate, which can be then bleached and made into a substance resembling white wax, and is used in the manufacture of candles and tapers under an Austrian patent. Price's patent candles factory, of Liverpool and London, is among its largest users. Have you ever heard of it being used in America? I am not aware of any being manufactured here, but large quantities of the raw material have been shipped to Europe. It is made into candles, toys and various ornaments, to make which wax was formerly employed. You would consider it a valuable article? If plenty of erdwax could be found, it would probably be more valuable than either Albertite or oil. Do you think there is any other coal in the eastern district except Albertite? Yes; I have evidence of the existence of fine anthracite and some bituminous coal. I am interested in a mine of bituminous or Tar coal in another locality. I have a half interest in the mine. You have, I suppose, noticed the presence of other minerals? Westmorland contains deposits of several valuable minerals; but there appears to be more iron than anything else, both of red and brown hematite and an immense quantity of iron pyrites. There are indications of copper, manganese, galena, and also of an oxide of silver. In Albert there are similar indications. The copper there is of a better class than that of Westmorland, being mostly black copper ore. Did you observe any silver ore? I am doubtful if there is any in Albert county. The formations, so far as found, are not such as would carry silver ore. In Kent there is silver, specular iron and bismuth - also a good deal of oxide of lead, large deposits of ochres, and, I think, other valuable minerals. Did you find any gold in your travels over the Province? Yes in several places; in alluvial soil, in washings and also in quartz; but the most that I have seen as yet has been in the alluvial deposits. Upon what land did you find these deposits? Upon government lands, which have been totally unexplored. Then the government yet has the right to all the advantages from a discovery of gold? There is little doubt that they have; but the mining laws of the province are so vague at present that, if I understand their tenor, the owner of the land has the exclusive right of mining, and therefore, can prevent the development of mines upon his land, should he choose to fix an exhorbitant price for the privilege. It is otherwise in Nova Scotia. Did you observe any graphite? I have seen some indications and small deposits of graphite, which I believe to extend right across the country. What is your opinion of its value? So far as what I have seen in New Brunswick, I do not consider it of such commercial value as would pay for working in large quantities. Why do you form this opinion? Because it lies in a small seam, in some places at great depth and intermixed with a hard slatey slate, which contains immense quantity of sulphur in the shape of pyrites, and the material itself is of a poor quality, and after being ground has a somewhat gritty nature and is only suitable for mixing with better qualities found elsewhere. Only fit for one or two purposes, and the expense of getting, manufacturing and mixing would be too great to permit it being placed on the market so as to compete with a better quality. What is the difference between plumbago and graphite? Nominally none; but commercially a very great deal. Plumbago is a much softer material and formed of pure carbon. Graphite, technically speaking, is also carbon, but it contains, or is allied with other and harder substances. Did you find zinc or tin? No tin; but a little zinc, principally allied with bismuth. I think it might be found in quantity, but have not been able to explore sufficiently. I have some good specimens of zinc. Did you observe any clay of commercial value, except for ordinary brick making? I did, and am somewhat interested in a property,which contains a large amount of an excellent quality of white pipe clay, also dark blue and red fire clay, which are both very valuable for fire bricks, tiles, etc., and all classes of pottery required to stand great heat. Practical men have pronounced it some of the best they have seen in America. Generally, how would you sum up your opinion of New Brunswick as a field for the investment of capital in mining enterprise? My own conviction is that it is a good field, having a varied and a rich class of minerals; but as yet the resources of the country are unknown, as little seems to have been done in the way of systematic exploration. What has been done, except cursory scientific explorations, has been done by a few private individuals more as a pastime than as a business enterprise. One great drawback, in my opinion, is that few people have a sufficient knowledge of minerals when they see them to really know their value. To this may be added, the lack of enterprise of the people generally, coupled with the apparent indifference of the Government in not seeking to have the real value of the land yet remaining to be

N.B. Courier - Nov. 18, 1837 LETTER VII. To His Excellency Major General SirJohn Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: In closing the communications I have had the honor of laying before your Excellency, I beg that I may be permitted to introduce some information obtained by others whom I had the pleasure to accompany on an excursion across the country towards Richibucto; and although the facts there collected are not wholly of a geological nature, their relation may not prove altogether useless and uninteresting to such as feel an interest in the welfare of the country. Our party consisted of Captain Egerton, Mr. Levinge, and the Hon. Mr. Cholmondeley, of the 43rd Light Infantry, M.H. Perley, Esquire, and myself, with five Indians hired for the purpose; namely, John St. Baptiste, Lewis Paul, Martin Paul, Sacobee Ottowin, and Joe Lola, each with a light bark canoe. Our departure was 7 taken from St. John on the 16th of August, and we arrived at the head of Grand Lake, in the Woodstock, steamer, in the evening of the same day. The party, excepting myself, was abundantly supplied with the instruments of death, and much time was spent in examining fishing tackle, salmon spears, fowling pieces, rifles, &c., which, when arranged along the deck, gave the boat a very warlike appearance. A large leather bag, pickaxe, and hammer, were insignificant objects beside the polished steel of my companions in arms, and among the often repeated sounds of bears, moose, cariboo, salmon and trout, the desire of finding a gold mine was seldom mentioned. Had the beasts of the forest and the fish of the Richibucto, have beheld this dreadful array, or known the determined resolutions for their destruction, they would have forsaken their native haunts, and fled from before their approaching foes. And such seems to have been the fact, for few of either tribe suffered by our advance upon them. The following day we embarked in our canoes, and proceeded eleven miles up the Salmon River, to a place called the Forks. In this distance the sandstones of the coal measures are the only rocks to be seen. There is a singular mound of fine sand thrown up on the south side f the river. Its elevation above the general level of the country gives it the appearance of an ancient fortification; but no relics were discovered to explain its history. The whole surface of the country around this place is not more than fifteen feet above the level of the lake, and viewed from the highest eminence appears like an extensive prairie, covered with a dense forest of spruce. The river flows along a crooked bed, skirted with rich intervale, and studded with majestic elms, whose broad shadows on the water were truly delightful as we paddled beneath the long umbrella spread over the way. Thus far the Salmon River is deep and tranquil, and not more than a hundred and fifty yards wide, abounding in lilies which were so numerous in some places as to resist the progress of our frail barks. Having ascended a considerable rapid above the Forks at the close of day, we landed, and the Indians in half an hour, erected a camp large enough to give longitudinal accommodation to ten persons. After a hasty supper torches were prepared, and all hands equipped for spearing salmon. In the darkness of midnight, our Nautilus fleet was launched, each canoe with a flaming torch hoisted at its prow. The long handles of the spears served to force the barks up the foaming rapids, into which the adventurer should always be prepared to slide, for altho' he may understand the art of balancing, and the laws of gravitation erfectly, an Indian canoe will sometimes demonstrate a new problem, and plunge him head-foremost into the stream. The river illuminated with brilliant lights, darting from side to side of its banks, and flashing upon 8 the polished steel, afforded a truly savage spectacle, while the hopes of striking a fish, and the expectation of being every instant compelled to dive, produced a little nervousness even in the Indians themselves. For this kind of amusement we were abundantly prepared, and it was conducted in true native style, only one thing was waiting to render it complete - but one salmon could be found. On the morning of the 18th, we parted with Messrs. Cholmondeley and Levinge, who entered the forest on the west side of the river, with old Sacobee, and Joe Lola, in quest of cariboo. They were several days in the woods without meeting with any game, and they returned with the solitary pleasure of having attacked and fairly beaten a large she bear and several cubs. Some fear had been expressed that these gentlemen would not endure the hardships of such a journey, but they returned in excellent health, having been much gnawed and stung by flies and musquitoes. With our lessened numbers and baggage, we then made a portage across the mill dam of John McAllister, Esq. Here the sandstone is exposed, and its strata may be seen having a gentle inclination to the northeast. Six miles farther up the river we landed to examine a mineral spring near a small collection of sand called Cast Away Island. The water of the spring flows from the coal measures, and will fill a hogshead every fifteen minutes. It has a very unpleasant odor and taste, and having been reported to be medicinal, a quantity wasafterwards brought away and analysed. The Indians seemed to think it poisonous, as they could not be prevailed upon to drink any quantity. I drank a pint from the fountain, and discovered that the water was gently sperient. By analysis it was found to contain in sixteen fluid ounces, Carbonic acid, Sulphuretted Hydrogen, Sulphate of Magnesia, grains, 4 Sulphate of Soda, grains 19.5 Oxide of iron, grains 4 It therefore differs but little from the sulphurous spring of Cheltenham, and will be found very efficaceous in cutaneous eruptions, and a variety of other disorders. The above analysis may not be found strictly correct as the salts in the water might have entered into new condunations before I had the opportunity of applying the proper tests for their discovery. Ascending the stream the interval diminishes, and the river runs along a smooth channel worn out of the sandstone; wherever the soil is sandy there are groves of pine and numerous wild flowers - the rose and the honeysuckle were seen blooming on the side of the unfrequented stream. A black dragon fly was found here differing from any I had seen, and other species are remarkable for the beauty of their colors. Several miles 9 above the Springs, a bed of the yellow oxide of iron was discovered - it would yield an abundance of ochre forpigments. From the increasing shallowness of the water, and violence of the rapids, our progress was greatly impeded, and we halted in a grove of pines for the night. We required not the skill of a French cook to prepare our supper, when the appetite is sharpened by labor, and abstinence, even the hasty preparation of the

Indian is received without any scrupulous enquiry respecting its absolute cleanliness. With our heads under our canoes and our feet opposite a great fire, we would have slept; but myriads of musquitoes trying to find soundings on our faces, rendered the labor of the night greater than that of the day. Several kinds of ointment were tried in vain, and it was impossible to wind a blanket around the head so tight as to admit of respiration, and keep the winged insects off. The natives suffered equally with ourselves, and nothing but a suffocating smoke had any effect upon these flying and singing armies. At sunrise next morning we again embarked and commenced scaling the stream with renewed vigor. Nothing can exceed the stillness and gloom presiding over the water between the rapids, which are often three miles apart. The sound of the bugle is delightfully re-echoed in the windings of the river, and often did our red brethren beg for a tune on the pee pee-quat. - The course of the stream is about northeast, and forty miles from Grand Lake it will average thirty yards in width. There is a sameness in the scenery that foils the memory and sets description at defiance. As far as vision extends, in every direction the surface presents one vast level tract, in many places occupied with groves of pines and towering hemlocks. Not a rock can be found, but such as belong to the coal series; these, when there are depressions in the strata, are covered with beds of sand and clay; of the latter there are collections of different colours, and such as are well adapted for the manufacture of the finest porcelain. One particular spotwas pointed out by old John, our guide, as favorite resort of the cariboo, and the natives have a tradition that that animal has long frequented this particular place to obtain something from the earth - probably asmall quantity of salt. The alcedo or kingfisher, only observed occasionally in any climate, is common on the Salmon River, and was seen constantly plunging into the water, and destroying great numbers of small fish. This bird was the halcyon of the ancients, who in the age of fable ascribed to it remarkable powers. Aristotle and Pliny have said that during the time of its sitting the mariner might pursue his voyage in safety, hence those days were called the halcyon days. Two kinds of the smallest wading birds, were seen upon the shores, and on the plains the 10 pigeons are numerous during the season of incubation, and when the whortleberry is ripe. The following remarks have been extracted from the Journal of Mr. Perley, who with Capt. Egerton, pursued the route to a greater distance than my time would allow. He says, ""the borders of the upper part of the Salmon River were found to consist of low land, with much meadow covered with alder. Below the 'Oxbow', where the river bends off very suddenly to the southward, we passed a number of short angles. Above, the water became deeper, and more placid. The river is here about thirty yards wide, and many tall pines on its banks, fling their broad shadows upon the deeply colored waters. Before arriving at the portage we noticed several extensive beds of clay, and red, and yellow ochre, on the sides of the river; but no stone of any description. At 5 p.m. we made up our packs, in a violent thunder storm attended with rain, and set out over the most dreary tract of country we ever beheld. The land between the Salmon River and Richibucto is very swampy and has been burnt over not many years since. The ground is completely covered with windfalls of all sizes, so that the portage path was blocked up. In three hours we had advanced only two miles, when we reached a thicket of green wood and encamped for the night, under torrents of rain. The Indians exerted themselves with great spirit, and notwithstanding all our clothes and blankets had been wet, since they were turned into the river by the upsetting of a canoe, and the rain had again given them another ablution, we slept soundly before the blazing fire. The bright sun of the next morning awoke us, and having cleaned our guns, and breakfasted, we followed a tolerable path to the distance of a mile, when we arrived at the head of the Richibucto. This river at the place where we first floated upon it, is about ten yards wide, having a gravelly bottom, clear water, and an abundance of small yellow trout, quite different from those taken from the water flowing into the St. John. The stream runs through an alder meadow, and groves of pine, spruce and elms, are seen only in the distance. At 2 p.m. the Indians returned from Salmon River with the canoes, and a more laborious task could not have been performed by men. After our embarkation the water was so shallow and the rapids so frequent, that our progress was slow, and at night we halted only six miles below the portage; in this distance the forest is composed of pine and fir, almost exclusively. The night being fine, we slept under the shadow of our canoes. Advancing down the river on the following day, the banks were carefully examined, but no rock could be found except the grey sandstone, identical with that of the Salmon River. Near Smith's Mill we opened a pretty settlement, the first we had seen on this side of the portage; the canoes and baggage were carried around the dam, which is one mile from the head of the 11 tide, and twenty six miles from the town of Richibucto. We here spent a large portion of the day in fishing, and I never met with a spot so well deserving the visit of the angler. In four hours we killed two hundred splendid sea trout, many of which were of 2 and 3 lbs. weight. These fish are shorter and thicker than the lake trout, and have a much brighter and more silvery hue. They are also stronger and when rising at the fly almost always throw themselves entirely out of the water, and seldom miss being hooked. With the ebb tide we dropped down the river, which gradually becomes wider, and runs between horizontal layers of sandstone. The soil (evidently the debris of the underlying rocks), is light and sandy. There are here many promising farms, and the fine fields of grain were strongly contrasted with the desert we had passed through. Below the mouth of the South, or Mill branch, the Richibucto opens into a wide handsome river - or what might be more properly called an arm of the sea; passing down, we noticed that the banks are composed of grey sandstone, passing into red, all laying into horizontal strata. Those rocks form a number of cliffs, in which the sea has worn numerous holes, and caverns, exhibiting a great variety of fanciful shapes and figures. We encamped below the Molus River, and the following day reached Richibucto, where, notwithstanding the forbidding appearance of our soiled Indian dresses, we enjoyed the kind of hospitality of W.J. Layton, Esquire, and other respectable gentlemen."" As I have already far exceeded the limits originally intended for these letters; I regret that I am unable to detail all the useful and interesting information gained by the indefatiguable exertions of Mr. Perley, on his return from the North Shore of the Province; and therefore I hope he will give a more elaborate account of it from his own pen. That gentleman and Captain Egerton were fifteen days on the tour; they encamped in the woods twelve nights, and were exposed to some very unpleasant weather, which, however, did not prevent them from returning home in perfect health, and in good spirits. The Indians also endured their hardships without a murmur, and were delighted with a tour so congenial to their natural habits. They are very intelligent, but less athletic than the Micmacs of Nova Scotia; their dialect differs much in some particulars, although these different tribes can generally understand each other. The Micmac of Nova Scotia calls a canoe Talactic - the Milicete of New Brunswick applies to it the word Pa-que-dan. The following are a few nouns of the latter race: Pessqua-haut Axe .... Tom-a-ha-gom Knife .... Me-go-da-nis Salmon spear .. Neck-an-gull 12 Tea kettle .... Check-lock-qe-gun Indian purse .. Patch-nau-goe Bugle .... Pee-pee-quat Paddle .... Ta-han-gen RIVERS Loosh-tork, } (The St. John) } the long river Magaguadavic the river of hills Oromocto the deep river Nashwaak the rapid river Nashwaak-sis the little river of rapids (sis being the Indian dimunitive) Richibucto the river of fire, or river of the burnt country Miramichi the happy retreat Restigouche the ..?.. river Pokiock the frightful river A lake is called quis-pam - a river, seep - brook, seep boo-sis. A doctor is denominated noo-chein-peel-wot. I observed that they called me noo-chein peel-wot pe-nops. Penops signifies stone, hence they implied a stone hunting doctor. Before I take leave of your Excellency, I beg to remark that the letters now concluded, have been prepared for the Press, amidst other and constant employment. A few typographical errors could not be corrected, in consequence of my distant residence from the publisher. Of the importance of obtaining an accurate Geological knowledge, and unfolding the mineral wealth of the Province, it is unnecessary for me to advance a single argument. My only object has been to render my favorite pursuits as useful to mankind as possible, and with the least degree of success I am satisfied. The kindness I received from all classes of the inhabitants during my visit among them claims my warmest acknowledgements. I am much indebted for the kind permission received, to address these letters to Your Excellency, and sincerely hope they prove interesting to one whom the loyal sons of the British Colonies in America justly delight to honor, and whose elevated character needs no encomium beyond the affections of the people. I have the honor to be Your Excellency's most obedient and humble Servant, A. Gesner. Parrsboro, Nova Scotia, } Oct. 17th, 1837 }"

Weekly Record - Fri., Feb. 3, 1903 A Queens County Industry. - An Ottawa despatch tothe St. John Telegraph says: 'Your correspondent learned today of an enterprise in New Brunswick likely to assume dimensions of grand proportions. Representatives of American and Canadian capitalists forming the works which owns the patent right for the Macadamite metal were in Ottawa today on business in connection with the new metal. It is intended to at once enlarge the works which have been established at St. John, but those interested have a larger plan in view. It is nothing less than the establishment in the vicinity of the coal fields in Newcastle, Queens County (N.B.), of works for the manufacture of aluminum, which is one of the elements of the macadamite metal, and for which there is an enormous and rapidly increasing demand. Two essentials are necessary for its successful manufacture, cheap clay of the proper percentage of oxide of silica, and cheap power. It appears that underlying the coal deposits ofQueens County (N.B.), is an abundance of fire clay which has been carefully tested and found suitable for the manufacture of aluminum. The abundant supply of coal ensures the other requisite of cheap power. Arrangements have been made with the New Brunswick Coal & Railway Co. for subletting a portion of its areas and a company to be called the Aluminum Production Company of New Brunswick is now in process of organization. The company will use a large quantity of coal in its factories and employ several hundred hands. Large contracts have been entered into for the supply of the metal to railway companies, and others, and those interested are confident of success."

Daily Morning Telegraph - Apr. 29, 1865 In another column we have copied an article from the Maine State Press, in reference to the geological formation of the rocks of Maine and New Brunswick. - There marks are penned in review of a lecture by Professor Hind in this city some time ago. The Head Quarters thinks that if the Province had not been in the midst of an election excitement at the time the Professor's address was given to the public, his statements, would, no doubt, have received the attention they merited. We are of the same opinion. We also heartily concur in the Head Quarters' suggestion, relative to the importance of a thorough survey of New Brunswick being ordered by the Legislature. We have urged this step on several occasions, and are daily becoming more impressed with its necessity for the full development of the wealth that lies buried in the earth in this Province. We have been much struck with the amazing apathy, arising from ignorance that prevails among our own people in regard to the mineral riches of the country. Foreigners are very much better informed on this subject than we are. A proof of this assertion is found in the fact, that, while scarcely a score of persons in the Province were aware of the existence of petroleum in Westmorland County, American geologists and chemists had examined the locality, American oil men had secured lands at Dover, and American companies had sent a large force of men, fully equipped with steam engines and the necessary apparatus, to bore for oil. It is known also that they have succeeded to a considerable extent, and fully anticipate realizing an ample fortune. The Editor of the Christian Visitor has just added his testimony to that of a number of other well informed persons, relative to the prospect for oil; and we have seen further evidence on this point from a scientific gentleman who has spent much time, money, and labor in his researches in oil districts, which is in the highest degree flattering. Writing on the subject to Sir Edwin M. Archibald, Her Majesty's Consul at New York, who is interested in oil lands in Albert, he says: ""I have been familiar with the oil regions of Pennsylvania and Virginia since the very commencement of the business, and can assure you, that, as far as surface indications are concerned, New Brunswick excels either. Oil springs, burning springs, salt springs and gum beds are numerous all along the belt to the northward and parallel with the line of upheaval across Albert and Westmorland Counties, in which upheaval asphaltum or Albert coal is found occupying a vertical fissure, the axis of an anticlinal. This oil territory, in many parts, particularly in the vicinity of the Albert Mines, bears a strong resemblance to the Virginia Oil regions. In Ritchie County, Va., they have a vertical vein of asphaltum, with a line of upheaval traceable through several counties. In the immediate vicinity of this line of disturbance the most productive oil wells have been obtained. In Westmorland and Albert counties, as you recede from the line of upheaval, the flexure of the strata becomes very gentle, lying nearly horizontal. The property which has been selected for the ""Albert Petroleum Company"" embraces some of the most valuable points in the oil territory, being fine boring ground, and easily accessible. At Steeves' Ravine is a natural Petroleum Spring, which has yielded from one to two barrels of oil daily, since the first settlement of the country. Several others are in the immediate vicinity, and at many other points in Albert, on your property, oil 7 and burning springs exist. At Fox Creek are gum beds and oil springs, and below the Church, at Memramcook are many oil shews. Territory in any part of the oil regions in this State or Virginia, with such surface indications as you have, would bring fabulous prices. Under judicious management and with proper energy employed in boring, I have no doubt that handsome dividends may be realised on your proposed capital. If we only had such territory here, [Penn.] it would be drilled like a cullender in a very short time."" These are remarkable facts and ought to be generally known. They are important in every respect, but especially important as showing the interest with the geology of the country. A thorough survey, such as Professor Hind is competent to undertake, we feel satisfied would add wonderfully to our knowledge of the mineral wealth of the Province, and lead to the opening up of a new branch of industry for our people. It is to be hoped that nothing will be permitted to

Carleton Sentinel - Oct. 13, 1860 Mineral Resources of the Lower Provinces. -- Among the specimens of the mineral wealth of the colonies, which were to be seen at the recent Industrial Exhibition at Montreal, not the least interesting and important were those forwarded from the county of Pictou. They comprised a section of the main seam of coal from the Albion Mines; a specimen of oil coal from the Frazer Mine; and a block of freestone from Acadia Quarries, which was cut in an octagon front inscribed with scriptual quotations, and between each word a Greek cross, alternately of red and yellow. The section of coal from the Albion Mines was shipped in square blocks, which when on exhibition were piled one on the other, to the height of 37 1/2 feet, showing at a glance the enormous and unrivaled depth of this wonderful deposit. Few persons even in Pictou residing within an hour's journey of the Mines, have perhaps anything like an adequate idea of the magnitude of the seam of coal from which this shaft was taken, and nothing can more correctly furnish this information than an inspection of a solid mass of coal, cut from the vein, although it may not comprise its full extent. A sample of this description, consisting of two blocks of solid coal, each about four and a half feet in length, and two feet in thickness at the base, was shown to us the other day by Major Norton, to whom they were presented by Colonel Scott, who also forwarded the pillar which was erected at the Montreal Exhibition. They now stand in the Consul's office, where he will be happy to afford those who may desire to do so, an opportunity of inspecting them. We were shown at the same time specimens of the productions of the Albert Mines of New Brunswick,consisting of the albertine in its natural state, as taken from the mine; the paraffine; a beautiful material resembling highly purified spermacetti, and of almost alabaster whiteness; the illuminating oil; and another liquid called kerosene, of a very inflammable nature, and used, we believe, principally for extracting grease from woollen or other clothes. These were forwarded to the Consul by the Kerosene Oil Company of Portland, where the product of the Albert Mines is manufactured. It may not be generally known that the unpromising looking material known as Frazer coal, a seam of which has been worked to some extent by J.D.B. Frazer, Esq., of ....wn, produces, besides the oil now extensively used in this country for illuminating purposes, the other two substances which we have mentioned. The paraffine is manufactured into candles, which in appearance closely resembles those made from sperm, but they give a more brilliant light and in other respects are preferable to the best sperm candles. -- Eastern Chronicle."

S. J. Daily Globe - Jul. 28, 1862 and Philanthropist - Jul. 31, 1862 and N.B. Reporter - Aug. 1, 1862 Great Exhibition. - Ores and minerals of New Brunswick. - No better arranged set of ores and mineral products are to be found among the colonial courts than that which is displayed by New Brunswick. The specimens, many hundreds in number, are of museum size, and neatly laid out in a series of eleven glazed cases, minutely subdivided within for the reception of each individual sample, which is numbered and named, with a reference book at the convenience of the visitor. Copper and iron pyrites, iron ore in various other combinations, such ashematite, magnetic iron ore, clay iron ore, and yellow oxide of iron, and that very useful state of the peroxide of iron, bog iron ore, are all shown in this collection. Tin and lead ores are two other very important minerals to be found here; also many specimens of building stones in red and gray granites, and very compact sandstones; a variety of green mottled serpentine, a brown carnelian, and white and red veined and white pure marble, serve to prove that New Brunswick possesses abundant material for the builder and sculptor. Gypsum, plumbago, and limestone, and above all the important substance, coal,is shown here in many highly bituminous specimens. The ""Albert coal"" of New Brunswick presents a lustrous conchoidal fracture like pith or glass, showing its highly bituminous character. It is admirably fitted for the manufacture of coal gas or paraffine. A vein of pure cannel coal, ten feet wide, has been found in Albert county. The value of the coal export is rising rapidly. In 1858 it was £13,743, and in the following year nearly three times as great. Among ornamental stones are agates, 6 jasper, garnets, and amethysts, and doubly refracting Iceland spar."

Codes: J8 / GEOL / IDX_Names: Albert Mines; Geology - General;
N.B. Courier - Oct. 4, 1851 Discovery of Fossil Fish in the Coal Formation of New Brunswick, by Dr. C.T. Jackson. - Dr. Jackson, in a letter to one of the editors, dated Boston, June 20th, announces the discovery of perfect specimens of fossilfish in the coal mine of Albert County, N.B., on the 5th of May last, and larger numbers on the 27th of May, and the Lepidodendra on the 6th of June. The following is cited from his letter:- ""I returned to Boston on the 12th, with numerous fossil fishes of Hillsboro', N.B., the miners having followed up my discoveries of May last, and found even better specimens than I had myself discovered on my first visit. ""You may feel interested in knowing that I have made out some of the genera, and found new species of fossil fishes, and that the Paleoniscus occurs abundantly associated with aquatic plants; also that a Lepidodendron, near if not exactly identical with the L. gracule, Br., is found with the fishes and with scattered fish scales in the same piece of the shale. Broad flat leaves like those of palms occur also in the fish shales of the coal mine and a curious blistered leaf is extremely abundant in all parts of the fish strata. These I at last traced to a stem. They appear to be a new species and remind me of our aquatic floating plant, the bladder-wort of our ponds. ""The occurrence of immense quantities of well preserved coprolites of fishes confirms the idea of Agassiz, that the heterocercal tailed fishes swam close to the bottom; for otherwise the form of such materials could not be preserved; for they were entire in the mud which ultimately enveloped them. There are herbivorous fishes associated with those that ate them and the excrements of some tell the tale that some of the fishes were cannibals! Some of the coprolites I have seen connected with the anus of the fish, appearing as if extruded by compression of the fish. Some of the fish appear to have been dead and partially putrid when they were enclosed in the strata, others evidently struggled against adverse fortune, erected their fins strongly to guard themselves from the tenacious mud which embalmed them in their last struggle. - In fact, these fishes are literally embalmed and not petrified, the bitumen which so richly charges the marly or soft clay slate or shale preserving in the most delicate manner every scale, fin, and the minutest markings; the scales retain their silvery hue slightly tinted yellowish brown by the bituminous matter."" - American Journal of Sciences, Sept.1."

Morning News - Sep. 22, 1862 and S.J. Globe - Sep. 23, 1862... - (London Morning Star of the 6th of September) - In minerals New Brunswick cannot vie with her sister colony of Nova Scotia. But within the past few years the discovery of a new species of coal or substance resembling coal has given an incentive to mineral research that promises to produce the very best results. This Albert coal, or""Albertine,"" so called from its having been found first in Albert County, has been a great puzzle to scientific men, and the source of some litigation, in order to decide what species it really belongs to. Gas Companies who had patents or charters for the sole privilege of making gas coal have instituted proceedings against parties who manufacture gas from ""Albertine"". And these defend themselves under the plea that the substance is not coal but ""asphalte"" - Scientific men from the U. States and elsewhere were summoned to decide the controversy, but one half declare it to be coal and the other asphalte. The science of the quidnunc is at fault, and the question still remains in dispute. The value of Albertine does not, however, depend on the ability of wrangling geologists to assign to it a place in the fervently incomprehensible nomenclature of their special science. The substance, whatever its name or order may ultimately be, Albertine, coal, or asphalte, is at present iluminating a large portion of the world in the form of gas or oil, producing a light that almost equals in brilliancy the light of geological science itself. Fifteen thousand tons of Albertine have been raised in a year, worth £3 per ton. During the past year a vein of pure Cannel coal, ten feet wide, has been discovered in the same country, and the mineral prospects of New Brunswick are looking up. The chief staple of the colony, however, is timber ..."

Royal Gazette - Nov. 17, 1852 Cap LXXXVII An Act to incorporate the Albert Mining Company Passed 7th April, 1852 Whereas a Joint Stock Company has been formed for the purpose of opening and working Mines in the County of Albert, who have expended a large sum of money in mining operations, and in the purchase of lands, erection of buildings, and making other improvements in connection therewith: And whereas the better to enable the said Company to prosecute the said business, it is deemed advisable it should be incorporated; Be it enacted by the Lieutenant Governor, Legislative Council and Assembly, as follows:-1. That Edward Allison, Jonathan C. Allison, David Allison, William Cairns, John Cairns, Alexander Wright, Nathaniel Gould, and James Dowie, their associates, successors and assigns, shall be and they are hereby erected into a Company, and declared to be a body politic and corporate, by the name of ""The Albert Mining

Company,"" and by that name shall have all the general powers and privileges made incident to a Corporation by Act of Assembly in this Province, for the purpose of opening and working Mines in the County of Albert, and establishing all necessary works connected therewith, and for the convenient carrying on and managing the same. 2. That the first meeting of the said Corporation for the organization thereof shall be held at Hillsborough, in the County of Albert, after fifteen days notice given in the Royal Gazette, by one member of the said Corporation; provided that the corporate powers shall not be deemed to be conferred upon said Company until a majority of members present at a meeting called as aforesaid shall determine to accept their Charter. 3. The capital stock of the said Corporation shall consist of the sum of thirty thousand pounds of lawful money, to be paid at such times and in such portions as the business of the Company may from time to time require, and to be divided into twelve hundred shares of twenty five pounds each. 4. The joint stock and property of the Company shall alone in the first instance be responsible for the debts and engagements of the said Company, and no creditor or person or persons having any demand against the said, for or on account of any dealings with the said company, shall have recourse against the separate property of any shareholder on account thereof, except in case of deficiency, or when the joint stock of the said Company shall fall short or not be equal to the payment of any debt due on demand against the same, that then and in such case the goods and chattels, lands and tenements of each shareholder, shall and may be levied 3 upon and seized respectively to satisfy such debt or demand, to the extent of double the amount of the share or shares or interest of such shareholder in the joint stock of the said Company, but no more. 5. That each and every shareholder in the said Corporation shall be held liable to the said Company for each and every call or assessment made (not however to exceed in amount the stock so subscribed for) for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, or to carry on the operations for which the said Company is incorporated, and shall and may be sued for by the said Corporation, and recovered in any Court of Record within the Province. 6. So soon as the capital stock shall have been paid in and expended for the purposes of this Corporation, it shall and may be lawful for the said stockholders, at any general meeting to be for that purpose called, to increase the said capital stock from time to time, in such sums as they may deem expedient, to a sum not exceeding one hundred thousand pounds, and they shall have power from time to time to increase the number of shares accordingly, or from time to time to assess such increase upon the original number of shares, or to increase the capital by both assessments and increase of shares. 7. The Company shall have the power to levy and collect assessments upon the shares from time to time, of such sums of money as may be deemed necessary for carrying on the business of the said Company; and whenever any assessment shall be made by the stockholders of the Company, it shall be the duty of the Treasurer to give notice thereof in a Newspaper printed and published in this Province, and also in the Royal Gazette, requiring payment of the same within thirty days; and if any stockholder shall neglect or refuse to pay to the Treasurer the amount of such assessment upon his shares at the time prescribed, it shall be the duty of the Treasurer to advertise all such delinquent shares for sale at public auction, giving at least thirty days notice of the time and place of sale; and all shares upon which the assessment is not then paid, with interest from the time such assessment became due, shall be sold to the highest bidder, and after retaining the amount of such assessment and interest due on each share, and the expense of advertising and selling, the residue, if any, shall be paid over to the former owner, and a new certificate or certificates of of the shares so sold shall be made out and delivered to the purchaser; provided always, that no assessment shall be made except by a vote of the stockholders and a majority of all the shares. 8. If at any time it shall be deemed necessary by the said Corporation, their agents or servants, to enter upon the estate, lands or grounds, being the private 4 property of any person or persons, for the purpose of carrying on their mining operations, they shall allow to the owners of such lands such reasonable compensation, by way of rent or otherwise, as may be agreed upon, for the damages such owner may sustain by reason thereof, and if the said Corporation shall not be able to agree with such owner or owners of the soil, as to the amount to be paid to the said owner or owners, for the damages he or they may sustain in consequence of such mining operations being carried on upon his or their land, then such compensation and satisfaction shall be determined by three disinterested arbitrators, one to be chosen by the said Corporation, and one by the owner or owners, occupier or occupiers of the private property in question, which two arbitrators so chosen shall choose a third arbitrator, and in case of their not agreeing in such choice within ten days after their appointment, then and in such case it shall and may be lawful for the Lieutenant Governor or Administrator of the Government for the time being, upon the application of the said Corporation, to appoint a third arbitrator; and the award of the said arbitrators, or any two of them, shall be final and conclusive in the matters referred to them; and in case any of the owners or occupiers of such private property shall decline making any such agreement or appointing such arbitrator, then and in every such case the said Corporation shall make application to the Supreme Court, or any Judge thereof, stating the grounds of such application, to issue a writ or warrant in such form as the said Court or Judge may prescribe to the Sheriff of the County of Albert, or in case he is interested, then to one of the Coroners of the said County, and in case the Sheriff and Coroners are all interested, then to some person or persons, commanding such Sheriff, Coroner, person or persons as the case may be, to summon and empanel a Jury of five freeholders with within the said County, who may be altogether disinterested, and do not reside within ten miles of the land in question, which Jury upon there oaths, (all which oaths, as well as the oaths to be taken by any person or persons who shall be called to give evidence in the matter, the Sheriff, Coroner, or person or persons summoning such Jury, is hereby empowered to administer,) shall inquire, ascertain, and assess the distinct sum or sums of money or annual rent to be paid as the amount of compensation and satisfaction for the damages that may and shall be sustained by such owner or owners, occupier or occupiers of such private property as aforesaid; and the inquisition, award or verdict of such Jury shall be returned and filed in the office of the Clerk of the Pleas of the said Supreme Court, shall be final and conclusive between the parties; which amount so assessed as aforesaid, and the costs and expenses of such proceeding to be taxed and allowed by the said Supreme 5 Court, shall be borne by the said Corporation, and shall be paid within thirty days after the said inquisition, award or verdict shall be filed as aforesaid, and until such payment shall be made the said corporation shall not be entitled to enter upon the said land, and in case an annual rent shall be awarded, unless such rent is paid within thirty days after it falls due, the power to enter under the said award shall be deemed to be annulled and discontinued. 9. Before the said Corporation shall contract any debts, a certificate shall be filed in the Office of the Secretary of the Province, verified by the oath of the Secretary or other principal officer of the Corporation, which oath any Justice of the Peace is hereby authorised to administer, to the effect that the sum of eight thousand pounds has been actually paid and expended for the purposes of the said Company, and unless such certificate be filed in manner herein directed, within three calendar months after the acceptance of this Charter, the corporate powers hereby conferred shall cease and become of no effect. 10. Nothing in this Act contained shall be construed to interfere with or compromise in any way the rights of the respective parties between whom suits are now pending for any matter, cause or thing which has happened or been committed before the passing of this Act, anything herein contained to the contrary notwithstanding. 11. Notwithstanding the provisions of the eighth section of this Act, the power and authority and provision contained in the said section, to enable the said Corporation to enter upon private property, shall only be deemed and taken to extend to the tract of wilderness land of one square mile, comprised in the lease or license from the Crown made under the Great Seal of this Province to Peter Duffy and John Duffy, bearing date the eleventh day of January one thousand eight hundred and fifty, and registered in the Office of the Secretary and Register of this Province on the twelfth day of January one thousand eigth hundred and fifty; nor shall this Act come into

Royal Gazette - May 31, 1854 Cap LXIV. 18 An Act to incorporate the Asphalte Mining Gas Company. Section Section. 1. Corporation, how 2. Office for business, constituted where to be kept. Passed 1sy May 1854. Whereas Theophylait Southerwaite, Eugene Legal, William B. Deen, Horatio Eagle, Frederick W. Cooledge, Laurent Delmonico and others, have formed themselves into a joint stock Company in New York, in the United States of America, under the title of ""The Asphalte Mining and Kerosene Gas Company,"" for the purpose of mining asphaltum, asphalte rock, and other minerals, the manufacture of illuminating, gas, burning fluids, &c., and for the manufacture of mastics, cements, and hydraulic concretes; Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The persons so formed into a joint stockCompany in New York, in the United States of America, as set forth in the Preamble to this Act, are hereby declared to be incorporated under the style of ""The Asphalte Mining and Kerosene Gas Company,"" and shall have all the powers and privileges made incident to a Corporation by Act of Assembly in this Province, for the purpose of mining asphaltum, asphalte rock, and other minerals, the manufacture of illuminating gas, burning fluids, &c., and for the manufacture of mastics, cements, and hydraulic concretes. 2. The said Company shall keep an office at Dorchester, in the County of Westmorland, and an Agent there for the transaction of business connected with the Corporation in this Province, service upon whom of all processes, notices, and other documents, shall be deemed sufficient service upon the said Corporation."

Morning News - Feb. 27, 1856 Mr. Gray presented a petition from the Albert Mining Company praying that an Act may pass to amend the Charter of said Company. The Bill in relation to the same being also presented was read for a first time."

Royal Gazette - Apr. 2, 1856 Cap. VIII. An Act to amend an Act intituled An Act to incorporate the Albert Mining Company. Section. Section. 1. New division of capital 5. Act 15 V, c. 87, s.4 stock authorized. Repealed. 2. Disposal of shares to 6. Issue of preference pay debts. Shares authorized. 3 3. Issue of shares 7. Act not to prejudice unlimited. Rights. 4. Responsibility for debts. Passed 26th March 1856. Whereas the Capital Stock of the Albert Mining Company has, under the powers of the sixth Section of the Act of Assembly of this Province by which the said Company was incorporated, been increased to one hundred thousand pounds, divided into four thousand shares of twenty five pounds each; a number of which shares, on which ten pounds per share assessment has been paid in to the said Company have been issued, and are now held by the shareholders thereof; And whereas it is the desire of the shareholders of the said Company that the said Act of Incorporation should be amended in several particulars:- Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The said Albert Mining Company shall have the power to accept from the shareholders thereof, a surrender of the twenty five pounds shares on which ten pounds assessment has been paid to the Company, and to make a new division of the said capital stock into ten thousand shares of ten pounds each; and to issue one of such new ten pound shares to each shareholder for and in lieu of every twenty five pound share on which such ten pounds assessment has been paid; and such new ten pound share shall be liable to no further call or assessment. 2. The residue of such new shares of ten pounds each may be issued and sold from time to time by the Corporation as full paid up shares, for the purpose of enabling the said Corporation to pay its debts and engagements, or to carry on the operations for which the said Company were incorporated. 3. Whenever four thousand one hundred shares of such new ten pounds full paid up shares shall be actually issued by the Company and held by shareholders thereof, no further sale or issue of shares shall be made, unless authorized by a vote of two thirds of the issued stock of the said Company at a special or general meeting of shareholders. 4. The joint stock and property of the said Company shall alone be responsible for the debts and engagements of the said Company. 5. Section four of the said Act of Incorporation is hereby repealed. 6. The shareholders may at any public meeting, by a vote of two thirds of the issued stock of the said Company, direct the issue of shares of the said Company, not exceeding one thousand, to be deemed and treated as shares entitled to receive out of the net profits of the said Company a dividend of six pounds per centum per annum thereon from the date of their issue, before any division of the profits of the said Company shall be applicable to the other stock issued and held by the shareholders thereof; such preferred shares to be subject to such terms and conditions as the shareholders authorizing said issue may impose. 7. Provided always, that nothing herein contained shall impair or prejudice the rights or claims which any person now has against the said Company, or its property, or the shareholders thereof, or any of them."

Royal Gazette - May 9, 1860 Cap. LXXII. An Act to enable the Prince of Wales Coal Company of the County of New York, State of New York, to hold property in this Province. Section. Section. 1. Company authorized to 2. Company to keep an hold real and personal Office and Agent in estate in Albert and Hillsborough. Westmorland for certain purposes; limit. Passed 9th April 1860. Whereas Albert G. Allen, Lyman W. Gilbert, James A. Alexander, and James Blight, have formed themselves, 10 with their associates, successors, and assigns, into a Joint Stock Company, in the County of New York, State of New York, in the United States of America, by the name of ""The Prince of Wales Coal Company,' for the purpose of carrying on Mining and Manufacturing operations in this Province, and are desirous of being enabled to hold real and personal property in this Province, as such Company, for the purpose aforesaid;- Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The Prince of Wales Coal Company of the County of New York, in the State of New York aforesaid, and their successors, shall and may by that name have full power and lawful right and authority to have, hold, own and enjoy in any way, real estate and lands of all kinds in the Counties of Albert and Westmorland, for mining and manufacturing purposes in this province, whether in fee simple, or by lease, or in any other way; and to have and to hold personal estate of all kinds in the said Counties of Albert and Westmorland in this Province, in any way, and to alienate, encumber, lease, sell or deal with the same in any manner; provided always, that the real estate so owned by the said Company shall not at any one time exceed in value the sum of twenty thousand pounds. 2. The said Company shall keep an Office in Hillsborough, in the County of Albert, in this Province, and an Agent there for the transaction of business connected with the Company in this Province, service upon whom of all processes, notices, and other documents, shall be deemed sufficient service upon the said Company."

Moncton Daily Times - Apr. 8, 1882 Legislature. - An Act to amend an Act intituled An Act to incorporate the Albert Mining Company, and to provide for winding up the affairs of said Company."

Daily Telegraph - May 28, 1882 Royal Gazette - May 31, 1882 Albert Mining Company. -- Winding Up Notice. Pursuant to provisions of the Act of the Legislature, notice is hereby given to all persons or person, or Corporate body, having any claim against The Albert Mining Company, to render their respective accounts and claims, duly attested, at the Office of the said Company, in the City of Saint John, within the period of six months from the time of the first publishing of this notice. Under said Act, all Creditors of said Company who shall not hand in their respective claims, duly attested, within the period of twelve months of the publishing of this notice, shall be respectively debarred from any participation in the proceeds of the sales of the Property of the said Company, and shall have no claims, either at law or at equity, against said Company. Dated this twenty fifth day of May, A.D. 1882. Henry Gilbert, President Albert Mining Company."

Daily Telegraph - May 28, 1882 Royal Gazette - May 31, 1882 Albert Mining Company. -- Winding Up Notice. In pursuance of the provisions of the Act of the Legislature, notice is hereby given, that the Presidentand Directors of the Albert Mining Company will, on the expiration of two months after the first publication of this Notice, sell and dispose of all the Real and Personal Property of said Company, and all Mining Leases and Mining Licences belonging to the said Company, as follows:- 1st. The Lands and Premises, with the Buildings thereon, of the said Company, situate in the Parish of Hillsborough, County of Albert, being the Lands on which the Pits opened by such Company are, consisting of about 1,300 acres, more or less. 2nd. The Tram-road leading from said lands to the Wharf of the said Company, at Petitcodiac River. 3rd. The Wharf Property of said Company, on Petitcodiac River, in Parish of Hillsborough. 4th. Two detached pieces of Land in said Parish of Hillsborough, consisting one of 4 and one of 5 acres. 5th. The Steam Engines, Plant, and other personal property of the said Company. For particulars, apply at the Office of said Company, 130 Prince William Street, Saint John, N.B. Dated Saint John, N.B., 25th May, A.D. 1882. Henry Gilbert, President Albert Mining Company."

S.J. Weekly Chronicle - Jun. 1, 1838 It has been suggested that a Geological Board should be formed, under whose direction Geological Surveys of the Province ought to be conducted; and at whose disposal, all sums of money granted by the Legislature for that purpose, should be placed. For reasons sufficiently obvious, this Board should be composed of persons of standing in society, of acknowledged acquirements, and holding public office; such as the Professors of Natural Philosophy of King's College, the Province Secretary, and the Commissioner of Crown Lands. It cannot be conceived, how Surveys conducted in any other manner can be useful to the Province; and they will only lead to the unprofitable and prodigal waste of the public money. We shall, otherwise, pay dear for many discoveries like the following: Black Lead - Plumbago, Graphite - This substanceis found in considerable quantity in a vein appearing at the surface, and running along the south west side of the hill at Fort Howe. It has been long known, under the first of the above names to

the inhabitants in the neighborhood, and has been used by them for common purposes, and some of it was collected by the accomplished Professor of Natural History and Chemistry at King's College, when he passed through this city about a year ago. The fields adjoining Fort Howe abound withvarious ores of iron; some specimens of which were sent to England nearly twenty years since. So much for the discovery of Mr. Gesner and the information of the Editor of the Courier. The principal localities of all our most useful minerals such as coal, marble, iron, manganese, are 6 pretty generally known in the districts where they abound. We only want capital and enterprise, and men withpractical knowledge to direct their proper employment. But it is evident, a vast deal of wealth must sink, before those productions of our soil can be worked with any advantage to the Public, or to those who are disposed to speculate in undertakings of this sort. The Geognosy of the Province is, doubtless, interesting as a branch of science, and will it is presumed, engage the attention of the Professors of King's College, to whose department it belongs, in the course of public instruction. [Communicated]."

Miramichi Gleaner - Nov. 14, 1837 Regulations for the Leasing of Mines and Minerals in New Brunswick. - All persons wishing to obtain a lease of Mines and Minerals must apply by Petition to His Excellency the Lieutenant Governor, in which Petition he must state particularly the district in which he wishes to work; whether he possesses the means to enable him to carry on his operations; to what extent he proposes to go. He must also state whether he owns the Land upon which he wishes to work; or whether, if owned by another person, he has made any, and what arrangements, with that person; and he will be required to produce evidence of the facts. The Petition must be accompanied by a sketch of 6 the ground applied for, shewing the granted lands, &c. &c. &c. Should the Lieutenant Governor in Council decide upon leasing the Mines applied for, the District will be submitted to public Auction, after due notice given as directed by Law. November 2d, 1837. ------Public Notice is hereby given, that a lease for fifty years of the Mines and Minerals, comprised within the Parish of St. Martin in the County of St. John, will be offered at public auction at the Crown Land Office, onMonday, the 4th day of December next, subject to the following conditions and restrictions: Conditions and Restrictions. That the purchaser shall have two years to explore and select his Mining ground, and open any shaft or shafts; that after the expiration of the said two years, the purchaser will be confined to such mines only as he may have opened and worked, and shall then have in

operation; and should it happen that during the said term of fifty years, any mine should not be worked for the space of twelve consecutive months, the said mine so remaining unworked, shall revert to the Crown, and that a per centage equal to one twentieth part of the produce of the mine or mines to be opened and worked, under the authority of the said lease, be exacted from and paid by the lessee or lessees, after the expiration of four years from the date of the sale or lease. Thomas Baillie, Comr. and Sur. Genl. Crown Lands. Crown Land Office, November 7, 1837."

Royal Gazette - Nov. 29, 1837 Regulations for the Leasing of Mines and Minerals in New Brunswick. All persons wishing to obtain a lease of Mines and Minerals must apply by Petition to His Excellency the Lieutenant Governor, in which petition he must state particularly the district in which he wishes to work; whether he possesses the means to enable him to carry on his operations; to what extent he proposes to go. He must also state whether he owns the Land upon which he wishes to work; or whether, if owned by another person, he has made any, and what arrangements, with that person; and he will be required to produce evidence of the facts. The Petition must be accompanied by a sketch of the ground applied for, showing the granted lands, &c. &c. &c. Should the Lieutenant Governor in Council decide upon leasing the Mines applied for, the District will be submitted to public Auction, after due notice given as directed by Law. November 2d, 1837."

Miramichi Gleaner - Sep. 25, 1838 and Royal Gazette - Oct. 17, 1838 Crown Land Office, September 14, 1838. - The following is published for the information of persons desirous of obtaining leases of Mines and Minerals in New Brunswick. All persons wishing to obtain a lease of Mines and Mnerals must apply by Petition to His Excellency the Lieutenant Governor, which Petitionmust state particularly the district in which the applicant wishes to work, and what means he possesses to enable him to do so, and to what extent he intends working. Whether he owns the Land upon which he wishes to work, or whether, if owned by another person, he has made any and what arrangements, with that person, and to produce evidence of the facts. The Petition must be accompanied by a sketch of the ground applied for. Should the Lieutenant Governor in Council decide upon leasing the Mines applied for, the District will be submitted to Auction as directed by Law, subject to the conditions which have been before published in the Royal Gazette. Thomas Baillie,

Royal Gazette - Jun. 9, 1841 Mining Lots in Westmorland. Crown Land Office, March 29, 1841. Public notice is hereby given, that the following Districts in the Count of Westmorland, viz.:- Beginning at the southwest angle of Mining Lot No. 1, (already leased to John Alexander and others), about 3 miles northwest from the Town of Dorchester, thence running by the Magnet north 2ø east 3 miles, thence north 88ø west 12 miles, crossing the River Petitcodiac in that distance, thence south 2ø west 6 miles, thence south 88ø east 15 miles, again crossing the Petitcodiac River and passing to the southward of Dorchester, thence north 2ø east 3 miles, and thence north 88ø west 3 miles to beginning, - comprising a part of the Parish of Dorchester and the greater part of Hillsborough, will be marked off into Mining Lots or Blocks of three miles square, on each side of a centre base line to run north 88ø west, from the southwest angle of Mining Lot No. 1 above mentioned, and numbering from Lot No. 1 to No. 10, agreeable to a Plan or Diagram of the same, to be seen at this office or with the Clerk of the Peace in Dorchester. The right of Mining on each Lot, separately, will be offered for sale at Public Auction at this Office on Monday the 5th day of July next, at 12 o'clock upon subject to the Regulations and Conditions herewith published, and any amendment or addition thereto which may be made by His Excellency the Lieutenant Governor in Council before the day of Sale, of which amendment or addition due notice will hereafter be given in the Royal Gazette. The expense of Surveying or marking the base line will be proportionally divided immediately after the Sale, between the lots which may be sold; and the proportionate part of the expense of Survey will be required to be paid in addition to the purchase money, and at the same time. John S. Saunders, Surveyor General. – Regulations and Conditions. 1st. That the upset price on each lot be œ50 (fifty pounds) and the whole amount of the purchase money on each lot to be paid on the day of the sale to the Receiver General or other person authorized to receive the same. 2nd. That the right of mining on each lot be separately put up for the term of twenty five years, at a fixed rent of five per cent. On the value of the minerals raised, with the exception of coal, on which a duty of one shilling currency per chaldron shall be paid quarterly, on the 1st of January, 1st April, 1st July, and 1st October, in each year, to the Receiver General, or an Agent for that purpose to be appointed by the Government. 3rd. That two years be given to each purchaser, from the day of sale, to explore his mining ground, within the lot purchased by him, which ground so to be selected is in no case to exceed three miles square. But no mining operations are to be commenced or prosecuted until the lease be taken out. 4th. That the purchaser of each lot, after having explored and selected his ground, shall cause a survey and plan thereof to be made by some duly authorized Deputy Surveyor of the Province, and filed in the office of the Surveyor General; and that after such plan shall have been confirmed at the said office, a lease of the mines comprised therein shall be forthwith made out in accordance therewith. 5th. That after the said lease is executed and delivered. 8 the lessee shall be allowed to work the said mines for three years, free of any rent or charge. 6th. That if the lessee shall not have actually commenced mining within two years after the date of the lease, the same shall be forfeited. 7th. That if the rent be behind or unpaid for the space of thirty days after the same shall become due, the lease shall be forfeited. 8th. That the lease contain a clause of renewal; and that the Government may take the improvements at a valuation to be made by arbitrators mutually chosen by the Surveyor General for the time being, and by the lessee or his assigns. 9th. That in no case shall a lease be executed for more than three miles square. 10th. That if the lessee or his assigns shall neglect to work the mines within his lease for any one year during the continuance thereof, the said lease shall be forfeited and revert to the Crown. – In Council, May 25, 1841. ""Ordered, That the Leasing of the Mines in the County of Westmorland, advertised to take place

on the 5th July next, be postponed for three months from that date."" In consequence of the above order in Council, the sale of the Mining Lots in Westmorland will not take place, until 12 o'clock, noon, on Monday the 4th of October next. John S. Saunders, Surveyor General. Crown Land Office, May 29, 1841."

Royal Gazette - Oct. 16, 1844 (No. 46). Crown Land Office, Sept. 28, 1844. Royal Gazette - Jul. 24, 1850 (No. 318). Crown Land Office, Jul. 5, 1850. One or more Mining Lots in the county of Westmorland will be offered for sale by Public Auction at this office, on Wednesday the seventh day of August next, at noon, agreeably to the following: Regulations:- 1st. That the right of mining within a Tract of one square mile, for the term of twenty five years, be put up at a fixed Rent of one shilling per Chaldron of Coal, and five per cent. on the value of all other minerals raised, to be paid quarterly, on the first days of January, April, July, and October, in each year, to the Receiver General, or an agent for that purpose to be appointed by the Government. 2d. That the upset preference price paid on each Lot be five pounds. 3d. That the preference money be paid and the ground selected within one hour after the time of sale, after which other Lots will be offered, ir required, in like manner. 4th. That if the Lessee shall not actually raise Coal or other Mineral to the value of one hundred pounds from his ground, within any one year after the first, during the continuance of his Lease, the same shall become forfeited. 5th. That the lease contain a clause of renewal; or that the Government may resume and take the improvements at a valuation to be made by arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his Assigns. Further conditions will be stated at sale. Thos. Baillie, Sur. Gen."

Royal Gazette - Jun. 19, 1850 (No. 313). Crown Land Office, May 31, 1850. One or more Mining Lots in the county of Saint John will be offered for sale by Public Auction at this office, on Wednesday the 3rd day of July next, agreeably to the following: Regulations:- 1st. That the right of mining within a Tract of one square mile, for the term of twenty five years, be put up at a fixed Rent of one shilling per Chaldron of Coal, and five per cent. on the value of all other minerals raised, to be paid quarterly, on the first days of January, April, July, and October, in each year, to the Receiver General, or an agent for that purpose to be appointed by the Government. 2d. That the upset preference price paid on each Lot befive pounds. 3d. That the preference money be paid and the ground selected within one hour after the time of sale, after which other Lots will be offered, ir required, in like manner. 4th. That if the Lessee shall not actually raise Coal or other Mineral to the value of one hundred pounds from his ground, within any one year after the first, during the continuance of his Lease, the same shall become forfeited. 5th. That the lease contain a clause of renewal; or that the Government may resume and take the improvements at a valuation to be made by arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his Assigns. Further conditions will be stated at sale. Thos. Baillie, Sur. Gen."

Royal Gazette - Jun. 26, 1850 15 CAP LIX An Act to to facilitate the operations of the New Brunswick Iron Company.

Passed 26th April, 1850 Whereas it may encourage the investment of British Capital in the works of this Corporation, if theterm of the Lease to Benjamin Wolhaupter were extended, and A Duty on one penny per ton charged upon the Iron manufactured, in lieu of the present reservation of five per centum on the value of the ore. 1. Be it enacted by the Lieutenant Governor, Legislative Council and Assembly, That from and after the time appointed for this Act to come into operation, it shall and may be lawful for His Excellency the Lieutenant Governor or Administrator of the Government for the time being, by and with the advice and consent of the Executive Council, to revoke, cancel or annul the present Lease to the said Benjamin Wolhaupter, and to issue a new Lease in lieu thereof to the New Brunswick Iron Company, their successors and assigns, for the term of ninety-nine years, to commence at and from the former lease, and to reserve in the said Lease so to be granted a Duty of one penny per ton on the Iron smelted by the said Company, in lieu of the Duty of five per centum now reserved in the present Lease. II. And be it enacted, That this Act shall not come into operation or be in force until the first day of September next."

Miramichi Gleaner - Mar. 18, 1850 Legislature. - Mr. J. Earle moved that an addressbe presented to his Excellency praying for a return relating to all mines and minerals in this Province."

Weekly Observer - Feb. 11, 1851 Friday, Feb. 28 Mining Licenses. On motion of Mr. Chapman, the House resolved itself into a Committee of the whole on a Bill to prevent the issuing of Mining Licenses. The Hon. Attorney General was opposed to the passing of this Bill - at least for the present. It might be attended by evil results, and the Committee should be cautious. If this Bill passed, it would give the grantees of land not only the soil, but all that lies under the soil, and deprive the licencees of minerals of the rights ceded to them. The Crown had hitherto reserved the right to mine, which in many instances had been ceded to individuals. Should this Bill pass, these individuals would come to the House and say, ""You have taken from us all that you ceded to us, for which we paid our money,"" and they would have a right to claim damages. Individual rights were now in abeyance before the courts, and the House should not come to any decision until the Courts had given their decision; each party had a right to be heard before a decision was come to affecting their interests. Government had come to the conclusion not to grant any more licences for the present, so that no harm could result from the Bill lying over for a while. He (hon. Attorney General) was retained on certain cases arising out of the Mining disputes, and therefore could not give his legal opinion at present. He would move that the Committee rise and report progress. Mr. Hannington would support the motion. A Select Committee on the Mining affairs was sitting, and he thought it better to pass over this Bill until the Committe had reported. - Progress reported."

Royal Gazette - Feb. 12, 1851 (No. 363). Crown Land Office, February 5, 1851. One or more Mining Lots in County of Albert, will be offered for sale by Public Auction at this office, on Wednesday the twelfth day of March next, at noon, agreeably to the following Regulations:- 1st. That the right of mining within a Tract of one square mile, for the term of twenty five years, be put up at a fixed Rent of one shilling per Chaldron of Coal, and five per cent. on the value of all other minerals raised, to be paid quarterly, on the first days of January, April, July, and October, in each year, to the Receiver General, or an agent for that purpose to be appointed by the Government. 2d. That the upset preference price paid on each Lot be five pounds. 3d. That the preference money be paid and the groundselected within one hour after the time of sale, after which other Lots will be offered, ir required, in like manner. 4th. That if the Lessee shall not actually raise Coal or other Mineral to the value of one hundred pounds from his ground, within any one year after the first, during the continuance of his Lease, the same shall become forfeited. 5th. That the lease contain a clause of renewal; or that the Government may resume and take the improvements at a valuation to be made by arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his Assigns. Further conditions will be stated at sale. Thos. Baillie, Sur. Gen."

Royal Gazette - Jan. 22, 1851 (No. 359). Crown Land Office, January 14, 1851. One or more Mining Lots in Carleton and Victoria Counties, will be offered for sale by Public Auction at this office, on Wednesday the twelfth day of February next, at noon, agreeably to the following Regulations:- 1st. That the right of mining within a Tract of one square mile, for the term of twenty five years, be put up at a fixed Rent of one shilling per Chaldron of Coal, and five per cent. on the value of all other minerals raised, to be paid quarterly, on the first days of January, April, July, and October, in each year, to the Receiver General, or an agent for that purpose to be appointed by the Government. 2d. That the upset preference price paid on ach Lot be five pounds. 3d. That the preference money be paid and the ground selected within one hour after the time of sale, after which other Lots will be offered, ir required, in like manner. 4th. That if the Lessee shall not actually raise Coal or other Mineral to the value of one hundred pounds from his ground, within any one year after the first, during the continuance of his Lease, the same shall become forfeited. 5th. That the lease contain a clause of renewal; or that the Government may resume and take the improvements at a valuation to be made by arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his Assigns. Further conditions will be stated at sale. Thos. Baillie, Sur. Gen."

Weekly Observer - Mar. 4, 1851 Friday, Feb. 28 Mining Licenses. On motion of Mr. Chapman, the House resolved itself intoa Committee of the whole on a Bill to prevent the issuing of Mining Licences. The Hon. Attorney General was opposed to the passing of this Bill - at least for the present. It might be attended by evil results, and the Committee should be cautious. If this Bill passed, it would give the grantees of land not only the soil, but all that lies under the soil, and deprive the licencees of minerals of the rights ceded to them. The Crown had hitherto reserved the right to mine, which in many instances had been ceded to individuals. Should this Bill pass, these individuals would come to the House and say, ""You have taken from us all that you ceded to us, for which we paid our money,"" and they would have a right to claim damages. Individual rights were now in abeyance before the Courts, and the House should not come to any decision until the Courts had given their decision; each party had a right to be heard before a decision was come to affecting their interests. Government had come to the conclusion not to grant any more licences for the present, so that no harm could result from the Bill lying over for a while. He (hon. Attorney General) was retained on certain cases arising out of the Mining disputes, and therefore could not give his legal opinion at present. He would move that the Committee rise and report progress. Mr. Hannington would support the motion. A Select Committee on the Mining affairs was sitting, and he thought it better to pass over this Bill until that Committee had reported. - Progress reported."

Codes: LEGI / IDX_Names: Legislation, etc.;
Weekly Observer - Mar. 4, 1851 House of Assembly, Monday, Feb. 24. Bill to Secure Mining Lessees in Their Rights. -The House went into Committee on this Bill, when Mr. Gray, the mover, entered into a brief explanation. He stated that, under present regulations, the Lessees were not protected - that other parties trespassed on their rights, and the law gave them no remedy, hence thenecessity for this Bill, which would enable them to prosecute trespassers. Mr. Ritchie was not satisfied with the explanation. This was a very grave question; one that was agitating the counties of Queen's, Albert, and Westmorland, and involving the rights of many persons. The question of mining had but recently attracted much attention, and it was scarcely known what the reserved rights of the Crown were; consequently it was difficult to discover what privileges were conveyed to the Lessees, and what were vested in the owners of the soil. Litigation had grown out of this uncertainty, several cases were now before the Courts, and the Judges had not yet given their decision. That being the case, he thought the House should be very careful how they dealt with the subject, lest they affect the interests of the parties now before the Courts. Many people thought - and it was his own opinion - that the right of minerals should be vested in the owners of the soil; (hear, hear). This subject had come before the House last year, and a select committee, of which he was one, was raised to report upon it. (The hon. member then read the Report alluded to, from the Journals of last year). There were certain parts of the Bill which he considered vague - he did not understand exactly what was meant. What was meant by the words ""The rights the Government conveyed and intended to convey?"" He considered there was no analogy between the Lessees of minerals and the Lessees of Crown timber. The latter went to work on wild lands; no other persons had any right there to come into conflict with their own; no one stood between them and the Crown. But the Lessees of minerals were authorised to go and dig on lands already sold and settled, - they were authorized to make roads, erect works, and take the coal or mineral away, in some cases to the serious injury of the farmer's property. He agreed with his learned colleague that legislation upon this subject was necessary, but he obtained to a partial measure. They should protect the owner of the soil, and decide by a general Act in whom the right to the minerals were vested. If it should be decided that the right was not invested in the owner of the soil, then the law should protect the land owner, and compel those who went on his property to mine, to pay him for every damage committed. He did not wish to be officious in this business, but he hoped the Government would see the necessity of taking up and investigating the whole matter, and define the rights of the owners of the soil. Mr. Hayward acknowledged the necessity of legislation upon the question, but thought this was not the proper time. The house should not interfere while litigation was going on, because it would be highly improper by any act of theirs to make the parties stand before the courts in a position different from that they now occupied. His Honor the Speaker was opposed to the Bill. He did not believe it was ever the intention of the Government, in granting lands and reserving the minerals, to licence others than the grantees, their heirs and assigns, to work these mines. This right was reserved to the Crown, in his opinion, that the Government might allow the mines to be worked or not, as they saw proper, and to enter into arrangements with the owners of the soil as to the amount of toll, provided the mines were worked. He thought some general measure was necessary. Mr. Botsford said the Bill was not fairly put before the Committee by its opponents. The case stood thus; the Crown had reserved a certain right, namely, the right to all minerals. This right the Crown had, in some instances, disposed of to private individuals; but those persons were not Lessees, as stated; they merely held licences authorizing them to go and mine. It had been already decided by the Supreme Court that the holders of those licences had no right to the coal or minerals any further than they worked, nor had they any right to the land; they were therefore unable to prosecute any party who might trespass within the limits of their respective grants. This Bill was for the purpose of protecting them, for under a simple licence they had no protection at all; the Bill would not interfere with the rights of the owners of the soil; it had nothing whatever to do with it, for where the Crown had once disposed of the right of soil, it was no longer Crown property, and Government could not dispose of it a second time, and the Bill, should it pass, could not be so construed. All the proprietors of the mines asked by this Bill, was to be placed in a position to protect what had been conveyed to them by licence. There was a difference of opinion upon the subject among the members of the bar, but the majority were of opinion that the licencees had no remedy at law against trespassers. It was also questioned if the Crown had any right to reserve minerals. This Bill would merely put the licensees in a position to institute proceedings against trespassers, and he hoped it would pass. The Attorney General did not think the Bill was properly understood by those who opposed it. He had just examined the Bill, and found the exposition made by the hon. member who had spoken last, quite correct; it was merely to protect the licencees. At present those who had no licenses,

went to work within the limits of others' licenses, and said to the licensees ""You have no right to the soil; you have no legal right to the coal any farther than you have dug; we'll go and dig, and you can't prevent it.' The Bill would not injure the owners of the soil, or interfere with their rights; it was merely to protect those who had taken out licence to mine, and paid their money for it. In order that no mistake could possibly arise, however, he had prepared an additional clause, which he hoped the hon. mover of the Bill would allow him to attach to it. (The hon. Attorney General then read the clause, which was to the effect that nothing in the bill should be so construed as to affect the rights of the owners of the soil.) The Bill would authorize the licencees to keep out strangers; the bill would prevent trespassers from interfering, as it would enable the licensees to prosecute. He thought it proper to inform the House that several of the legal gentlemen present were engaged in the litigation arising out of the mining question. His learned friend (Mr. Ritchie) was retained to defend the rights of the owners of the soil. The other learned member from the county of St. John was engaged on the other side, and he (Mr. S.) was himself engaged, but not in a manner to interest him in the success of the Bill. He had thought it proper, however, to apprize hon. members of the fact. His Honour the Speaker wished to hear it explained how it was a Licencee had no remedy at law against trespassers. Hon. Attorney General would explain. A Licencee merely received authority to go and work on the Crown reserves, but if another went to work alongside of him, or entered one of his coal-pits that he might have temporarily abandoned, and raise coal therefrom, and the Licencee could not prosecute him, he himself possessing from the Crown merely power to work. The Crown was the only party that could prosecute trespassers, and to do so would be attended with great trouble and expense. The same rule applied to the parties licenced to cut timber; they could not sue trespassers, but the Government could proceed against them by seizing the timber when cut. Mr. Needham said the Bill was quite plain; a wrong existed, for which the law provided no remedy; this Bill provided that remedy. The case stood thus: A was a licencee; B comes in upon his license, digs coal, or minerals, and takes them away, and A is not authorized by his license to prosecute him. This Bill would give him that power. Mr. Gray entered into some further explanations. He had no objection to adding a proviso, as recommended by the hon. Attorney General. The Bill had been well explained by

Morning News - Feb. 13, 1852 Mining Leases. - King's County, Feb. 8, 1852 Sir. - Will you permit me to make a few observations on a question now before the Provincial Legislature, the importance of which I by no means think, ought to be underrated, because, as yet, the benefits are only prospective. I allude to the mineral wealth of New Brunswick, at present invested in the Crown, but which itis thought by many, ought to be transferred to the landholders. I must confess that, in the first instance, I was, myself, inclined to this belief, but on more mature deliberation, I clearly saw that it must involve us in difficulties which were not at first apparent, but are of too grave a character to be overlooked. Mining, it must be recollected, is a very expensive and uncertain operation, and can only be carried on in a proper and efficient manner, and so as to be really remunerative by those who are possessed of both capital and experience. The land owners of New Brunswick do not generally possess tracts of any great extent, and the subdivision of this class of property amongst them, did they, through such a distribution all participate in it, which they of course could not, would individually be but trifling. It is fact becomes a mere lottery as to who may or may not partake in it. Then should an individual have a good fortune to discover indications of mines and minerals on his property, a place of probably very limited extent, he still remains quite ignorant of how it may be beneath the surface - he has, most likely neither the capital or skill to work it himself, and those who have, will most likely be deterred from undertaking it, through the difficulty they are likely to meet with, in an endeavour to purchase up the right of a sufficient number of the neighboring proprietors, to warrant their commencing operations with a certainty of success. How frequently do we find, in cases of this sort, men whom you cannot by any means induce to part with their right; and the operation of works of incalculable advantage to the Country may thus be prevented. The boundaries of property on the surface are easily defined, but no so underground, and the innumerable disputes that must consequently from time to time arise, may readily be conceived. The proprietors of land in New Brunswick purchased their lands with a perfect understanding that the mines and minerals were to remain the property of the Crown, and it is consequently inflicting no rejustice on any one that they should still be retained as they now are public property; didn't really believe that the transfer to the landowners would become an unquestionable public benefit, I should, notwithstanding, say by all means let it be done; but I do not really believe this to be the case. If this property continues in the hands of Government and is judiciously managed, there is, I think little doubt that it will greatly augment the revenue of the country, and in which all will equally participate. The properties, whose ground is required to be occupied, may receive the full value of all that is required. The population in the neighborhood of the works will be greatly increased; a market for both labor and produce formed, and the value of property greatly enhanced - should, however, the transfer be made. I very much fear, it will be quite otherwise, and that owing to the difficulties likely to arise; the Government may in a few years be glad to purchase back again that right which they now possess and may retain without any impropriety or injustice whatever. I am, Sir, Your Obedient Servant, A landholder."

Weekly Observer - Mar. 16, 1852 Tuesday, March 16, Two o'clock.The Bill vesting the right of Mines in the proprietors of the soil where Licences are not already granted, passed in Committee with an agreement, as the House was thin, the question should be taken on the third reading."

Novascotian - Mar. 29, 1852 Mines and Minerals. - A bill confirming the mines and minerals of New Brunswick to the owners of the soil has passed the House of Assembly of that Province."

Carleton Sentinel - May 16, 1852 (Wed. March 10) .... The Mining Bill was committed and discussed. This Bill provides that present lessees of Mines may enter on private property by paying damages. If parties can't agree, a jury living 10 miles or more distant to assess damages. No provision has been made defining the rights of future lessees. The 1st section sustained by an overwhelming majority. Progress reported."

Carleton Sentinel - May 23, 1852 (Mar 15) .... Today the House went into committee on a Bill that, except present lessees, none but owners of land had a right to mine there on - They are to get a licence from Government - the Government to fix the price of the licence."

Carleton Sentinel - May 23, 1852 (Mar 16) ... Above Bill passed second reading"

Royal Gazette - Nov. 10, 1852 (No. 453). Crown Land Office, November 6, 1852. The subjoined amended Regulations regarding future sales of Mining Rights, are published for the information of all concerned:- 1. Owners of Land may apply for a Lease of the Mining Rights reserved by the Crown in the Grants of such Lands, and the same will be offered at public auction, after sixty days notice. The application to be accompanied by evidence of the title, and by a plan of survey of the Land made by a Deputy Surveyor. 2. The term of the Lease will be twenty five years, and will contain a clause of renewal, or that the Government may resume and take the improvements at a valuation, to be made by Arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his Assigns. 3. The upset preference price to be five pounds, and payment to be made within one hour after the time of sale. A fixed rent of one shilling per chaldron on coal, and five per cent on the value of all other minerals raised, to be paid quarterly, on the first days of January, April, July and October in each year, to the Receiver General, or an Agent for that purpose to be appointed by the Government. The statement on which such payments are to be, to be on oath. 4. That if the Lessee of his Assigns shall not actually raise coal or other mineral to the value of one hundred pounds, from his ground, within any one year after the first, during the continuance of the Lease, the same shall become forfeited. 2 R.D. Wilmot, Sur. Gen."

Morning News - Apr. 26, 1854 Fredericton, April 24. - The Mining Bill was lost to-day on the third reading, by 18 to 16."

Carleton Sentinel - Mar. 17, 1855 Mr. Steadman thought that the right to all mining operations should be in the owners of the soil ..."

Miramichi Gleaner - Mar. 24, 1855 and N.B. Courier - Mar. 24, 1855 March 21. - The Mining Bill passed the House this morning, subject to an amendment by the Attorney General, to the effect that license must be had by the owners to raise the coal, and that all other parties must, inaddition to a license, have the concurrence of the owners."
1855 - Copied from: Weekly Record - Fri. Sep. 11, 1891 ... a copy of the act that was passed and especially confirmed and ratified, and finally enacted by an order of Her Majesty in Council, dated the twenty-fourth day of September 1855, and published and declared in the province the thirty-first day of October 1855. Anno Decimo Octavo Victoriae Reginae. Chap. LXXVI. An act relating to Mines and Minerals. 1. Right of mining vested in the owner of the soil. 2. Governor in Council authorized to grant licenses under regulations. 3. Exemptions from operations of Act. 4. Suspending clause passed April 12, 1855: ""Whereas it is only just and proper that all Mines and Minerals of every description should pass with the soil to the grantee of the crown, and be vested in him:- 1. The exclusive right of digging and raising Coal or other Minerals shall be vested in the owner of the land wherein such Coal or Minerals is found to exist; but before he shall dig or raise such Coal or Mineral he shall obtain License therefore from the Governor in Council. 2. The Governor in Council may issue a license to the owner of any land, or his assignee, for that purpose, to dig and raise Coal and other Minerals therefrom, upon such terms and on such payment of such rent or royalty, and subject to such rules and regulations, as the Governor in Council may prescribe. 3. This act shall not affect, impair or interfere 6 with the rights or duties of any license acquired under any license granted before it comes into operation, nor with any grant in which the Minerals are not reserved. 4. This act shall not come into operation until Her Majesty's Royal approbation be thereunto had and declared. (This act was specially confirmed, ratified, and finally enacted by an order of Her Majesty in Council, dated the 24th day of September 1855, and published and declared in the Province the thirty-first day of October 1855.)"

Morning Freeman - Jul. 7, 1860 How totally the proclamation in the last Gazette confutes all that the Smasher press said in defence of the Government, when they succeeded in crushing mining enterprise so effectually, and their mercenaries said they only did what the law compelled them to do. Read:- Mining Regulations. Every licence of Minerals to be exempted from payment of Royalty for three years from the date of the Licence. The Royalty on Shale to be reduced to Six pence per Chaldron. The Royalty on all Metallic Ores, except Gold and Silver, to be reduced to two and a half per cent. By His Excellency's Command S.L. Tilley. Secretary's Office, 30th June, 1860"

Royal Gazette - May 9, 1860 Cap. LXXX. An Act to incorporate the Gloucester Mining Company. Section. Section. 1. Company incorporated. 5. Authority to assess 4 2. First meeting, time and capital for business place of. purposes. 3.

Capital, amount and 6. Act void if 25 per division into shares. cent of capital be not 4. Liability for debts. subscribed within two years. Passed 9th April 1860. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. That William Deacon, John Dunn, Jospeh G. Simpson, Charles B. Record, James McAllister, Thomas M. Brown, and Charles B. Harrison, and their associates, successors, and assigns, shall be and they are hereby declared to be a body corporate and politic, by the name of ""The Gloucester Mining Company,"" and by that name shall have all the general powers and privileges made incident to a Corporation by Act of Assembly of this Province, for Mining purposes. 2. The first meeting of said Corporation shall be held at such time and place in this Province as may be appointed by a majority of the above named persons. 3. The capital stock of the said Company shall be fifty thousand pounds, divided into five thousand shares of ten pounds each. 4. The joint stock and property of said Company shall alone be responsible for the debts and engagements of the same. 5. The said Company may from time to time make such calls or assessments upon the capital stock thereof, as they may deem necessary for carrying on their operations, and such call or assessment when made, shall be deemed a debt due from the shareholder to the said Company 6. That unless twenty five per cent of the capital stock shall be subscribed within two years after the passing of this Act, the operation of this Act shall cease and determine."

Further conditions of Lease may be ascertained in the Crown Land Office.

Codes: LEGI / IDX_Names: Legislation, etc.;
Daily Telegraph - Sep. 25, 1866 Mining Licenses For Sale. - The Government offers for sale, by public auction, one or more mining licenses in the county of Carleton, one or more in the county of Victoria, and one or more in the county of Northumberland, - all on Tuesday, 4th September, at the Crown Land office, Fredericton. The advertisement states that ""the purchase money must be paid, and the ground (one square mile for each lease) selected, within one hour after the time of sale."" The upset price is $20 a mile. We hope that Mr. Connell and the government will introduce into the regulations of the office something that will provide for the publication of the names of parties to whom such licences issue. This is especially desirable in consequence of the scanty information afforded by the form of the advertisement when the licenses are offered for sale. The form of the sale is called ""public auction"", and there is presumed to be competition; but this is a mistake - The applicant is not known; the locality is not stated, except as regards the ""County"", nor is the species of mineral, which it is proposed to be mined, named. We would suppose that if the interests of the public require the fact of the applications being made, to be gazetted at all, they must require the information afforded by the advertisement to be more detailed and definite. In the counties named above - Carleton, Victoria and Northumberland - iron and gold have been found."

Royal Gazette - Apr. 3, 1867 (370) Crown Land Office, 27th March, 1867 Mining Licences in the Counties of Queen's and Sunbury, will be offered for sale at this Office, by Public Auction, on Wednesday the 8th day of May next, at noon. Upset price, $20 per Lot. The purchase money must be paid and the grounds selected, within one hour after the time of sale. - Conditions ascertained at this Office. C. Connell, Sur. Gen."

Royal Gazette - Apr. 17, 1867 (376) Crown Land Department, 10th April, 1867 Mining Licences in the Counties of Restigouche, Gloucester, Northumberland, York, Carleton, and Victoria, will be offered for sale at this Office, by Public Auction, on Wednesday the 15th day of May next. Upset price, $20 per Lot. The purchase money must be paid and the grounds selected, within one hour after the time of sale. - Conditions ascertained at this Office. C. Connell, Sur. Gen."

Royal Gazette - Jan. 30, 1867 (355) Crown Land Office, 30th Jan., 1867 Mining Licences in the Counties of Sunbury and Queen's,will be offered for sale at this Office, by Public Auction, on Wednesday the 13th day of March next, at noon. Upset price per Lot, $20. The purchase money must be paid and the grounds selected, within one hour after the time of sale. - Conditions ascertained ay this Office. C. Connell, Sur. Gen."

Royal Gazette - Jun. 19, 1867 (394) Crown Land Office, 12th June, 1867 One or more Mining Licences in the County of Victoria, will be offered for sale at this Office, by Public Auction, on Wednesday the 10th day of July next. Upset price, $20 per Lot. The purchase money must be paid and the grounds selected, within one hour after the time of sale. - Conditions ascertained at this Office. C. Connell, Sur. Gen."

Royal Gazette - Sep. 11, 1867 (421) Crown Land Office, 11th Sept., 1867 Mining Licences in the Counties of Carleton, York, Victoria, Northumberland, Gloucester and Restigouche, will be offered for sale by Public Auction at this Office, on Wednesday the ninth day of October next, agreeably to the Regulations. . Upset price, $20 per Lot. – 1st. - Every mining Lease to be exempted from payment of Royalty for five years from its date. 2nd. That the right of Mining within a Tract of one Square Mile, for the term of twenty five years, be put up at a fixed rent of one shilling per Chaldron on Coal, and five per cent on the value of all other Minerals raised, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Governor. 3rd. That the upset price for each Lot to be five pounds. 4th. - That the preference money be paid, and the ground selected within one hour after the time of sale, after which other Lots will be offered if required, in like manner. 5th. That the lease contains a clause or renewal, or that the Government may resume and take the improvements at a valuation to be made by Arbitrators mutually chosen by the Surveyor General for the time being, and by the Lessee or his assigns. 6th. - That if the Lessee shall not actually raise Coal or other Mineral to the value of four hundred dollars per mile from this ground within any one hear after four years from date of said Lease, and so on annually during the continuance of the Lease, the same shall become forfeited. Charles Connell, Sur. Gen."

Daily Morning Telegraph - Apr. 20, 1869 ....Butler's bill relating to Mines and Minerals...."
S.J. Daily News - Apr. 21, 1869 Legislature. - MINES AND MINERALS - ROYALTIES. - Mr. Butler next committed a bill to repeal the present law relating to mines and minerals, and make new provisions in lieu thereof. The object of the bill is to do away with royalties. Mr. Butler made a very good speech in condemnation of the present system, and said that the bill now before the House had been recommended by two or three committees of the House. The tax was a great burden upon capitalists. Mr. Needham supported this bill. He believed that a man when he bought property was entitled to all above and

all below. Hon. Mr. King dissented from this view. A man was certainly entitled to all that he bargained for. But, if after land had been granted, a gold mine were discovered, the grantee would get more than he bargained for, and would it not be fair that the Province should have a portion of the proceeds? It was a fair and reasonable method of raising a revenue. In a country with small mineral resources, the expense might eat up profits. But, if the Province should prove to be rich in minerals, the case would be altogether different. It would be premature to legislate until the result of the present geological survey was made known. He laid it down as a principle that it was not only fair that the original grantor should still have an interest in whatever might lie beneath the soil, of which he was ignorant. The present bill, too, would take away from the Province the large revenue which was derived from the Albert Mines. At the suggestion of Messrs. Moore, Gough, Needham and others, the further consideration of the bill was postponed until the next session of the Legislature. As the mail closes to-day at three o'clock, I must close, too. P."

Royal Gazette - Feb. 21, 1872 Mining Regulations. Province of New Brunswick. (On Granted Land.) 1. On payment of a Fee of Ten Dollars, License to be granted to the owner of the soil, or his assigns, for a period not exceeding twenty five years. 2. Every Mining Licence to be exempted from payment of Royalty for ten years from its date. 3. From and after the expiration of such period of ten years, the Rent or Royalty upon Coal to be twenty cents per chaldron, upon Shale ten cents per chaldron, and upon all Metallic Ores, except Gold and Silver, two and one half per cent upon the value thereof when raised or dug, provided that such Royalty shall not be exacted during continuance of such License, if the Licencee or his assigns shall make it appear on oath to the satisfaction of the Lieutenant Governor in Council that the profits of the undertaking, over and above reasonable expenses, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested. 4. No License shall, without special provisions, include the right to dig, raise or mine gold or silver, and in such case the Lieutenant Governor in Council shall have the right of reserving such Royalty as shall seem proper in respect of such metals. 5. The Rent or Royalty, when payable, shall be paid quarterly on the first day of February, May, August and November in each year, to the Receiver General, or an agent for that purpose to be appointed by the Lieutenant Governor in Council. The statements on which such payments are to be made are to be on oath. 6. No Licenses shall be granted in respect of Lands previously the subject of Mining License unless specially approved by the Lieutenant Governor in Council. Licenses heretofore issued may be surrendered, and Licenses in lieu thereof issued in accordance herewith, where it shall appear to the satisfaction of the Lieutenant Governor in Council that mining operations have not been profitably conducted under previous License. 7. The license shall only continue during the existence of the legal title or interest to dig Coal or other Minerals therefrom of the Licencee, or his assigns. [Approved in Council January 19th, 1872]"

Royal Gazette - Jul. 23, 1873 CAP. LXXXVIII. An Act to incorporate the Lake George Railway Company. Sec. Sec. 1. Company incorporated. 4. Company may run, free 2. Power of Company to take of charge, Railway, lands, &c.; payment for, &c. over Crown Lands. How settled. 5. Capital stock. 3. When required, Company may build Railway, &c. Passed 14th April, 1873. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. That Francis Hibbard, Arthur Hill Gillmore, Elldorado Gillmore, and Tobias Gillmore, all of the Province of New Brunswick, and J.J. May, of the City of Boston, in the State of Massachusetts, and Jed Frye, of the City and State of New York, their associates, successors and assigns, are hereby constituted a body politic and corporate, by the name of ""The Lake George Railway Company,"" for the purpose and with the power of constructing a Rail or Tramway from Harvey, in the County of York, to the Antimony Mine in the Parish of Prince William in said County, in the Province of New Brunswick. 2. Whenever, for the purpose of the said Company, lands or rights of way contiguous to the mines or other property of the Company may be requisite for the laying, constructing, or the erection of any road, railroad or tramway, or of any buildings, wharf, dock, or other place for storing or shipping the metal or other minerals dug or manufactured by the Company, and when no agreement for the purchase of such lands or right of way can be made with the owner or owners thereof, the said company, or the Directors thereof, may apply to a Judge of the Supreme Court by petition, with a correct plan of the premises in question thereto annexed, on oath, praying a conveyance of such lands and rights of way required; and such petition shall set forth, by mete and bounds, the nature, situation and quantity of the lands or rights of way required, the names of the owner and occupier thereof, and any further particulars which the case may require; whereupon if the Judge

be satisfied that such lands or rights of way, or any part thereof, are actually required for carrying out the purpose and operations of the said Company, he shall appoint a time and place for the consideration of such petition, and direct notice of the object of such application to be given to the owners and occupiers of such lands, either if practicable by personal service, or if not, by publication thereof for at least two weeks in a newspaper published at the city of Fredericton, requiring them to attend at the time and place appointed, to shew cause why an order for such conveyance should not be made, and at such time and place the Judge may either proceed at once to order the parties interested to make all necessary conveyances, upon such terms as he may see fit to order and direct; or if he deem it necessary to order that the lands or rights of way so required be examined and surveyed by appraisers to be by him appointed, of whom one appraiser shall be named by the petitioners, one by the respondents, and the third by the Judge, or if the respondents do not appear, two of such appraisers shall be named by the Judge, due proof being furnished to him of the service or publication of said notice; the appraisers shall forthwith proceed to examine and value the lands or rights of way so required, to ascertain the necessity for them and the quantities of land required; and in their valuation they shall not take into account the enhanced value of any such lands and premises, by reason of the operations of the said Company, or of any discovery by them upon their own lands of minerals, ores or other metallic substances, or any further works or operations by them contemplated; and the valuation of such appraiser, or any two of them, shall be returned in writing and upon oath to such Judge as soon as may be, whereupon the said Judge shall fix a time and place for hearing such award or valuation, of which all parties shall have due notice, either by their Attorney or as aforesaid; and at the return of such notice, and upon hearing all parties interested, the said Judge shall have power to allow, modify, approve or reject such valuation, and in case of rejecting the same, shall proceed as before to the appointment of other appraisers, and so on as often as the case may happen; if the valuation be approved or modified, the Judge may make such order in the premises, as to the payment of costs and awards, and the mode of conveyance of such lands or rights of way, as he may deem expedient; and any conveyance made under such order shall be registered in the County in which the premises conveyance shall be, and have the same operation and effect as if made by the owner or owners of the fee to the said Company. 3. The said Company may when required make or construct a railway or tramway over and across any roads in the line of the projected railway and tramway, and over any brooks, streams or rivers or public lands, subject nevertheless to regulations to be made by the County, for the protection and Municipal Corporations of the County, for the protection and safety of the inhabitants and their property, and the preservation of public and private rights, and may build, erect and make harbour piers, breakwaters and shipping places for minerals of any kind, coal and metal, or other productions of the said Company upon any lands owned or lawfully held by the Company or acquired under this Act, or upon the shores of the River Saint John or other lands of the Crown. 4. That the said Company shall have all the rights of making a railway or tramway and of erecting bridges over any stream, or of taking any material for the construction of said road upon the lands belonging to the Crown, and the said Company, shall not be compelled to bring the matter before any Judge of the Supreme Court as above provided, but shall have all the rights named in this section free of any charge for damage. 5. The capital stock of the said Company shall be one hundred thousand dollars, divided into one hundred shares of one

Royal Gazette - Nov. 5, 1873 (820) Crown Land Office, 5th Nov., 1873 Mining Leases on Crown Lands in the County of Kent, will be offered for sale by Public Auction at this Office, on Wednesday the third day of December next, on the following terms and conditions:- 1 - Every mining Lease to be exempted from Royalty on Coal and all other minerals, except Gold and Silver, for ten years from the date thereof. 2 - That the right of Mining for the term of twenty five years, within a Tract not exceeding five square miles, as may be applied for within any County, shall be put up at a fixed rent of twenty cents per chaldron on Coal, and five per cent on the value of all other minerals, including Gold and Silver, raised or dug, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Lieutenant Governor in Council; provided that such Royalty shall not be exacted during the continuance of the Lease, if the lessee or his assigns shall make it appear on oath to the satisfaction of the Lieutenant Governor in Council, that the profits of the undertaking, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested; and provided also, that the Lessee or Assignee shall furnish to the Receiver General, or such Agent as aforesaid, quarterly, at the days above named, statements on oath of the quantity of Coal raised, and the value of all other minerals raised or dug. 3 - That the upset preference price shall be twenty dollars per square mile. 4 - That the preference money be paid by the purchaser immediately upon the lot being bid off, after which other Lots will, if applied for in the same county, be offered for sale in like manner. The first purchaser shall be required to select his ground within twelve months after day of sale. The second purchaser within twelve months and ten days, and so on; each purchaser being allowed ten days more than his predecessor. 5. That the Leases contain a covenant for renewal, or that the Crown may resume possession and take the improvements at a valuation to be made by Arbitrators appointed, one by the Surveyor General and one by the Lessees or his Assigns. In case the Lessee or his Assigns fail to appoint an Arbitrator within ten days after being required by written notice served upon the Lessee of his Assigns, if in the Province, or after publication of such notice for one month in the Royal Gazette, then the Surveyor General shall have the power to appoint two Arbitrators; such Arbitrators appointed in either case aforesaid, shall select a third, the award of any two of whom shall be final. 6. That if the Lessee shall not actually raise Coal or other Minerals to the value of four hundred dollars from his ground within any one year, (the first five years excepted) during the continuance of his Lease, the same shall become forfeited. 7. Mining Leases heretofore issued and not now liable to forfeiture may be surrendered, and Leases in lieu thereof issued in accordance with these Regulations, where it shall appear to the satisfaction of the Lieutenant Governor in Council, that Mining operations have not been profitably conducted under previous Licence. Benj. R. Stevenson, Sur. Gen."

Royal Gazette - Nov. 19, 1873 (23 Crown Land Office, 15th Nov., 1873 Mining Leases on Crown Lands in the County of Queen's,will be offered for sale by Public Auction at this Office, on Wednesday the 17th day of December next, on the following terms and conditions:- 1 - Every mining Lease to be exempted from Royalty on Coal and all other minerals, except Gold and Silver, for ten years from the date thereof. 2 - That the right of Mining for the term of twenty five years, within a Tract not exceeding five square miles, as may be applied for within any County, shall be put up at a fixed rent of twenty cents per chaldron on Coal, and five per cent on the value of all other minerals, including Gold and Silver, raised or dug, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Lieutenant Governor in Council; provided that such Royalty shall not be exacted during the continuance of the Lease, if the lessee or his assigns shall make it appear on oath to the satisfaction of the Lieutenant Governor in Council, that the profits of the undertaking, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested; and provided also, that the Lessee or Assignee shall furnish to the Receiver General, or such Agent as aforesaid, quarterly, at the days above named, statements on oath of the quantity of Coal raised, and the value of all other minerals raised or dug. 3 - That the upset preference price shall be twenty dollars per square mile. 4 - That the preference money be paid by the purchaser immediately upon the lot being bid off, after which other Lots will, if applied for in the same county, be offered for sale in like manner. Royal Gazette - Apr. 1, 1874 (No. 855) Crown Land Office, 11th March, 1874 Mining Lots in the County of Charlotte will be offered for sale at this Office on Wednesday the 15th day of April next, at noon, agreeably to existing Regulations. Benj. R. Stevenson, Sur. Gen."

Daily Tribune - Mar. 17, 1874 Legislature. - Mr. Palmer committed a bill to amend the incorporation act of the Hopewell Free Stone and Mining Company, Mr. Harrison in the chair. The bill changes the name to Hopewell Quarry Company, enables the Company to hold its annual meeting in Boston, increases the stock, requires the Treasurer to sign stock certificates, etc. Agreed to."

Daily Tribune - Mar. 31, 1874 Legislature. -... Referring to Hibbard he compared him, in times gone by, to the old war horse champing the bit and pawing the ground, but now where was he? Mr. Hibbard. - You made me ashamed of you. Mr. Gough said since the first mining grant in 1872 Mr. Hibbard had shown the taint..."

Royal Gazette - Jul. 21, 1875 CAP CXX. An Act to amend an Act intituled An Act to incorporate the Sussex Lime and Plaster Company. Sec. Sec. 1. Capital stock. 3. When ten per cent. must 2. Sec. 12, 37 Vic. be paid in"

Royal Gazette - Jun. 30, 1875 Crown Land Office, June 19th, 1875 A mining Lease for one or more square miles on Crown Landin the County of Saint John, agreeably to the following Mining Regulations, will be offered for sale by Public Auction at this Office, on Wednesday the 28th day of July next, at noon. 1 - Every mining Lease to be exempted from Royalty on Coal and all other minerals, except Gold and Silver, for ten years from the date thereof. 2 - That the right of Mining for the term of twenty five years, within a Tract not exceeding five square miles, as may be applied for within any County, shall be put up at a fixed rent of twenty cents per chaldron on Coal, and five per cent on the value of all other minerals, including Gold and Silver, raised or dug, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Lieutenant Governor in Council; provided that such Royalty shall not be exacted during the continuance of the Lease, if the lessee or his assigns shall make it appear on oath to the satisfaction of the Lieutenant Governor in Council, that the profits of the undertaking, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested; and provided also, that the Lessee or Assignee shall furnish to the Receiver General, or such Agent as aforesaid, quarterly, at the days above named, statements on oath of the quantity of Coal raised, and the value of all other minerals raised or dug."

Daily Tribune - Mar. 19, 1875 Mr. Covert thought the system on which the diamond borer was run needed improvement. The subject was discussed at considerable length, and the discussion turned also to repairs of the house of Assembly. ... The mining grant of $2000 was passed."

Codes: LEGI / IDX_Names: Legislation, etc.;
St. Andrews Standard - Mar. 24, 1875 House of Assembly. - Mar. 18. - The mining grant of $4000 passed, and the grants voted were reported to house."

1876 - Copied from: Weekly Record - Fri. Sep. 25, 1891 I will give it to you and you will find by comparing the act of 1855 with the act of 1876 to be the very same in every particular, that is as far as the vested rights are conveyed to the owner of the land giving the owner the absolute right to mine the minerals on the said owners land. Consolidated Statutes of N.B., Chapter 18, page 177. Mines and Minerals -- Salt mines. 1. The Governor in Council shall grant remuneration consistent with public interest to any person who shall first discover and make known to the government the situation of any deposit of Rock Salt within the province. 2. Such remuneration shall be continued to a portion of the revenue derived therefrom. Gold mines. 3. The Governor in Council is hereby authorized to make rules and regulations digging and mining for gold in and upon ungranted crown lands, and to authorize the granting of leases for that purpose without competition. Coal and other mines. 4. The exclusive right of digging and raising coal or other mineral, shall be vested in the owner of the land wherein such coal or mineral is found to exist; but before he shall dig or raise coal or mineral he shall obtain license therefor from the Governor in Council. 5. The Governor in Council may, except in cases where the owner has the right to mine without paying royalty, issue a license to the owner of any land, or his assignees for that purpose, to dig and raise coal and other minerals there from, upon such terms and on payment of such rent or royalty, and subject to such rules and regulations as the Governor in Council may prescribe. 6. All veins or deposits of coal on granted lands known as surface veins and not exceeding two feet in thickness may be mined and worked, and the said coal removed, shipped and disposed of, without the payment of royalty. 7. The aforegoing sections shall not affect, impair or interfere with the rights or duties of any license acquired under any license heretofore granted, nor with any grant in which the minerals are reserved."

Royal Gazette - Aug. 8, 1877 Crown Land Office, August 6th, 1877 Mining Licences on Crown Land in the County of St. John, agreeably to the following Regulations, will be offered for sale at this Office, at noon, on the 5th day of next month. 1 - Every mining Lease shall be exempted from Royalty on Coal and all other minerals, except Gold and Silver, for ten years from the date thereof. 2 - That the right of Mining for the term of twenty five years, within a Tract not exceeding five square miles, as may be applied for within any County, shall be put up at a fixed rent of twenty cents per chaldron on

Coal, and five per cent on the value of all other minerals, including Gold and Silver, raised or dug, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Lieutenant Governor in Council; provided that such Royalty shall not be exacted during the continuance of the Lease, if the lessee or his assigns shall make it appear on oath to the satisfaction of the Lieutenant Governor in Council, that the profits of the undertaking, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested; and provided also, that the Lessee or Assignee shall furnish to the Receiver General, or such Agent as aforesaid, quarterly, at thedays above named, statements on oath of the quantity of Coal raised, and the value of all other minerals raised or dug. 3 - That the upset preference price shall be twenty dollars per square mile. 4 - That the preference money be paid by the purchaser immediately upon the lot being bid off, after which other Lots will, if applied for in the same county, be offered for sale in like manner. The first purchaser shall be required to select his ground within twelve months after day of sale. The second purchaser within twelve months and ten days, and so on; each purchaser being allowed ten days more than his predecessor. 5. That the Leases contain a covenant for renewal, or that the Crown may resume possession and take the improvements at a valuation to be made by Arbitrators appointed, one by the Surveyor General and one by the Lessees or his Assigns. In case the Lessee of his Assigns fail to appoint an Arbitrator within ten days after being required by written notice served upon the Lessee of his Assigns, if in the Province, or after publication of such notice for one month in the Royal Gazette, then the Surveyor General shall have the power to appoint two Arbitrators; such Arbitrators appointed in either case aforesaid, shall select a third, the award of any two of whom shall be final. 6. That if the Lessee shall not actually raise Coal or other Minerals to the value of four hundred dollars from his ground within any one year, (the first five years excepted) during the continuance of his Lease, the same shall become forfeited. 7. Mining Leases heretofore issued and not now liable to forfeiture may be surrendered, and Leases in lieu thereof issued in accordance with these Regulations, where it shall appear to the satisfaction of the Lieutenant Governor in Council, that Mining operations have not been profitably conducted under previous Licence. York and Northumberland, agreeably to the following Regulations, will be offered for sale at this Office, at noon, on Wednesday the 18th day of December next. 1 - Every mining Lease shall be exempted from Royalty on Coal and all other minerals, except Gold and Silver, for ten years from the date thereof. 2 - That the right of Mining for the term of twenty five years, within a Tract not exceeding five square miles, as may be applied for within any County, shall be put up at a fixed rent of twenty cents per chaldron on Coal, and five per cent on the value of all other minerals, including Gold and Silver, raised or dug, to be paid on the first days of January, April, July, and October, in each year after the fifth, to the Receiver General or an Agent to be appointed by the Lieutenant Governor in Council; provided that such Royalty shall not be exacted during the continuance of the Lease, if the lessee or his assigns shall make it appear on oath to the satisfaction of the Lieutenant Governor in Council, that the profits of the undertaking, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested; and provided also, that the Lessee or Assignee shall furnish to the Receiver General, or such Agent as aforesaid, quarterly, at the days above named, statements on oath of the quantity of Coal raised, and the value of all other minerals raised or dug. 3 - That the upset preference price shall be twenty dollars per square mile. 4 - That the preference money be paid by the purchaser immediately upon the lot being bid off, after which other Lots will, if applied for in the same county, be offered for sale in like manner. The first purchaser shall be required to select his ground within twelve months after day of sale The second purchaser within twelve months and ten days, and so on; each purchaser being allowed ten days more than his predecessor. 5. That the Leases contain a covenant for renewal, or that the Crown may resume possession and take the improvements at a valuation to be made by Arbitrators appointed, one by the Surveyor General and one by the Lessees or his Assigns. In case the Lessee of his Assigns fail to appoint an Arbitrator within ten days after being required by written notice served upon the Lessee of his Assigns, if in the Province, or after publication of such notice for one month in the Royal Gazette, then the Surveyor General shall have the power to appoint two Arbitrators; such Arbitrators appointed in either case aforesaid, shall select a third, the award of any two of whom shall be final. 6. That if the Lessee shall not actually raise Coal or other Minerals to the value of four hundred dollars from his ground within any one year, (the first five years excepted) during the continuance of his Lease, the same shall become forfeited. 7. Mining Leases heretofore issued and not now liable to forfeiture may be surrendered, and Leases in lieu thereof issued in accordance with these Regulations, where it shall appear to the satisfaction of the Lieutenant Governor in Council, that Mining operations have not been profitably conducted under previous Licence. Daily News - Apr. 7, 1880 Provincial Assays. - The following is the Report of Assays made by the Provincial Assayer, during the year ending February 29, 1880.- The work done may be classified as follows: 1. Assays of ores - 44, silver 37, lead 20, iron 9, copper 13, zinc 7, manganese 3, arsenic 7, antimony 6. Total -- ores 146. 2. Analyses of limestones 14. 3. of mineral manures 14. 4. of soils 11. 5. of waters 4. 6. of coals 3. 7. of graphites 2. 8. of oils and drugs 8. Total 202. The above assays were made for parties residing in all parts of the Province. No charge, except for chemicals, was made in any case. The assayer requests that the following notice be inserted in the Gazette. Parties wishing to purchase mining stock are advised to procure for themselves and send for assay, samples of the ore; and not trust to certificates held by parties owning the mine. The certificate given by the assayer refer to the samples as sent; but do not vouch for the locality of the specimens or guarantee them to be fair samples of the vein from which they were taken. Codes: LEGI / IDX_Names: Legislation, etc.;
S.J. Daily Sun - Aug. 27, 1881 Our Mining Regulations. - Since the late sale of mining rights for Gloucester and Restigouche, which realized the handsome figure of $3,425, the attention of the public has been more directed to the subject of mines and mining than for many years past. We were surprised on looking over the Mining Regulations for New Brunswick, approved in Council, 21st Dec., 1872, to find them so loose and unfair. Under these the course pursued by any one desirous of securing a right to mine within a tract not exceeding five squaremiles, naming the county. This is offered for sale by public auction at the Crown Land Office at the upset price of $20 per square mile. If there is no opposition the applicant gets his right at that rate. He may then have another right offered, or indeed as many as he pleases immediately after the sale of the first. The first purchaser is allowed 12 months after the day of sale in which to select his ground, the second purchaser having twelve months and ten days, and so on; each purchaser being allowed ten days more than his predecessor. The result of this is that when the purchaser pays his $20, the right to search for minerals for the whole county is tied up for a year; for certainly no one would prospect for a mineral vein which could be taken away from him without any chance of competing for it. When the purchaser locates his mining right he is entitled to a lease for a term of 25 years. Under this lease he is bound to pay five per cent. on the value of all other minerals raised or dug on the premises, excepting coal, in case the profits of the undertaking exceed six per cent. Had the tax been five per cent. on the Profits of the company's operations, no one could have complained very much, but when five tons out of every 100 tons of ore are declared the property of the Crown, without its having to contribute one cent towards the expense of raising it, the burden becomes most onerous. The lease, by these regulations, is also required to contain a covenant for renewal, or that the Crown may resume possession and take the improvements at a valuation to be made by arbitrators, without naming what improvements are to be valued or what are to be considered improvements. Thus, after a company has developed a mine, and by its shafts and drifts exposed a very valuable vein of ore, it may be taken away by the Crown, at the end of 25 years, merely by paying for the Improvements made by the company and nothing for the ore that may be exposed. We think, therefore, that, taking these matters into consideration, it is high time the regulations should be altered and that the subject of our mines and minerals should receive the attention which it demands. The whole subject should be studied up, and the mining regulations of other countries examined by some person competent so to do, who should be required to report on the advisability of adopting such portions of them as may be suitable to the wants and requirements of the Province. Nova Scotia appears to be very far ahead of New Brunswick in this matter. There they have a Commissioner of Mines, Mr. Gilpin, a very competent and useful officer, to whom that Province is indebted for several very valuable and useful reports, and there they also have, we are informed, excellent mining regulations."

Royal Gazette - Apr. 9, 1884 Crown Land Office, 9th April, 1884.The following amended Regulations, to govern the issue of Mining Licences on Granted Lands, were approved in Council the 3rd April instant:- Mining Regulations (On Granted Lands.)
[Approved in Council 3rd April, 1884] 1. On payment of a Fee of Ten Dollars. Licence to be granted to the owner of the soil, or his Assignee, for a period not exceeding twenty five years. 2. Every Mining Licence to be exempted from payment of Royalty on Coal and all other Minerals, except Gold, Silver, Copper, and Lead, for five years from its date. 3. From and after the expiration of such period of five years, the Rent or Royalty upon Coal, (except surface Coal as provided by Chapter 18, Consolidated Statutes, Sec. 8,) to be twenty cents per chaldron; upon Shale ten cents per chaldron; and upon all Metallic ores, except Gold, Silver, Copper and Lead, two and one-half per cent upon the value thereof, when raised or dug; provided that such Royalty shall not be exacted during continuance of such Licence, if the Licencee or his Assigns shall make it appear on oath, to the satisfaction of the Lieutenant Governor in Council, that the profits of the undertaking, over and above reasonable expenses, and the Royalty to the Crown, do not exceed six per cent on the capital invested. 4. The Royalty on Gold, Silver, Copper, and Lead, shall be five per cent, payable from the date of the Lease, upon the gross amount of Gold, Silver, Copper, and Lead, mined by any mode whatever, subject however, to the proviso in Regulation No. 3 5. The Rent or Royalty, when payable, shall be paid Quarterly, on the first day of February, May, August, and November, in each year, to the Receiver General or an Agent for that purpose to be appointed by the Lieutenant Governor in Council. The statements on which such payments are to be made are to be on oath. 6. No Licences shall be granted in respect of Lands previously the subject of Mining Licence, unless specially approved by the Lieutenant Governor in Council. Licences heretofore issued may be surrendered, and Licences in lieu thereof issued in accordance herewith, where it shall appear to the satisfaction of the Lieutenant Governor in Council that Mining operations have not been profitably conducted under previous Licence. 7. The Licence shall only continue during the existence of the legal title, or interest, to dig Coal or other Minerals therefrom, of the Licencee or his Assigns. 8. The Licence to be accepted subject to any altered or amended Regulations to be approved by the Lieutenant Governor in Council. James Mitchell, Sur. Gen."

Dated at the Office of the Provincial Secretary at Fredericton, the sixteenth day of September, A.D. 1890. James Mitchell, Provincial

Royal Gazette - Apr. 22, 1891 Passed April 22:An Act relating to mines and minerals."

S.J. Daily Sun - Jan. 21, 1891 Crown Land Mining Licenses. - For The Sun, by Edward Jack, C.E. - As New Brunswick has not for many years advanced in the system it has pursued in the management of its crown timber and farming lands at all in keeping with the advance in the value of wood, as well as with the increasing scarcity of good land for farming purposes, so it is stationary in the matter of the management of its mineral resources. Under the regulations now in force here the right of mining for the term of 25 years within a tract not exceeding five miles may be offered for sale at Public auction at an upset price of twenty dollars per square mile. Immediately upon the lot applied for being bid off, other lots applied for in the same county will be offered for sale in like manner, the first purchaser being required to select his ground within a year after the day of sale, the second purchaser within a year and ten days, and so on, each purchaser being allowed ten days more than his predecessor. Supposing, now, for example, that I apply for a mining lease in one of the counties in New Brunswick and at the day of sale become the purchaser. Finding that I have met with no opposition, I call upon the surveyor general of his deputy to offer another square mile, and another until 37 square miles have been sold costing but $20 per mile. I would then have the exclusive right to select any square mile of mining land in the county for two years at a cost of under $800. In most cases a square mile is much more than is needed, and in fact the system is not at all in accord with those regulations which the advancing mining interests of America have found to be the best. Then again, the lease given under these New Brunswick mining regulations is not what it ought to be. For instance, it contains a clause that at the expiration of the term of 25 years the crown may at its option grant a renewal for another period of 25 years, or pay the party holding such license a fair valuation for all machinery and other improvements, with the usual arbitration clause. There is also a provision in the lease that no payment shall be made by the crown for any such machinery or improvements, unless the shafts, drifts, drains and workings of the said mine or mines which may have been opened, and all improvements and machinery be delivered up to the crown in good order and condition, and that no payment shall be made for any machinery or improvements erected or set upon the surface of the lot or tract below the line of high water mark. The meaning of this latter very peculiar clause seems to be that if there should be a wharf built in connection with a mill that the crown, when it assumes possession of the latter under the clause in the lease, shall not be required to pay for such wharf. The title conveyed of these leases is not such a one as a person could go to the capitalists with and ask them for large advances for the purpose of opening up and developing mines. It is in fact such a one as investors would be careful to steer clear of, since were an extensive mining company organized the stockholders would know that their title expired in 25 years. It is true that the government would have to pay them for the machinery and improvements (whatever the latter word covers, which is very uncertain), but that would be poor consolation to those who after 20 years of work and who perhaps had just begun to get fair dividends for their money owing to the discovery of a paying lead, that at the expiration of five years the government might take this lead from them without having to pay them anything for it."

St. Croix Courier - Jul. 30, 1891 The following persons, as appears by notice in the Royal Gazette, have made application under the General Mining Act for licences covering lands in Charlotte County: License to Search. John F. Adams, 5 square miles on the east of L'Etang Harbor E.H. Barter and Geo. J. Clarke, 5 square miles nearMoore's Lake. Daniel DeWitt, 5 square miles at Clarendon Settlement.T. Dick and I. Williamson, 5 square miles at Mascarene. G.W. Ganong, 1 square mile at Simpson's Island; 5 square miles at Milltown. Jas. M. Lord, 5 square miles at Basswood Ridge; 2 square miles at Tinker's Island. Jas. R. McLean, 5 square miles on Knight's Stream; 5 square miles on Dennis Stream, north of the town of St. Stephen; 5 square miles west of L'Tang Harbor. John McGibbon, 5 square miles in the south part of Deer Island. Guy Pendleton, 5 square miles at the north of Deer Island. Jennie W. Smith, 5 square miles on Dennis Stream. Wm. F. Todd, 5 square miles on Basswood Ridge road; 5 square miles including the town of St. Stephen."

Fredericton Daily Gleaner - Mar. 18, 1891 Mr. Mitchell introduced a bill entitled An act relating to Mines and Minerals."

Codes: LEGI / IDX_Names: Legislation, etc.;

S.J. Daily Sun - Mar. 20, 1891 Mines and Minerals. - Full Text of the Bill Introduced by the Surveyor General. - Some Radical Changes Proposed by the Local Government. - The bill relating to mines and minerals, introduced by the surveyor general, makes some radical changes in the existing provincial regulations, which are known to be very crude and defective. Briefly stated, the chief features of the bill are: Aliens as well as British subjects may enjoy its benefits by complying with its provisions. That in all grants of soil in which mines and minerals have been excepted and reserved to the crown such mining rights are properly separate from the soil, and constitute independent public property. All veins or deposits of coal on granted lands known as surface veins and not exceeding two feet in thickness are excepted from the operations of this act and may be worked, etc., without payment of royalty. Neither the surveyor general nor any officer of his department or officer appointed by authority of this act shall be directly or indirectly interested in any mine or mining operations, nor shall he act as agent or attorney of any person interested therein, under a penalty of $1,000 for each offence. Gold and Silver Mines. - When satisfied of the discovery of gold or silver in any locality, the governor in council may, through the Royal Gazette, proclaim such locality a gold district, and define its limits. Quartz mines, so far as practicable, shall be laid off in areas of 150 feet lengthwise of the general course of the strata, and 250 feet across. These to be known as Class No. 1. Areas shall be laid out as far as possible uniformly, and in quadrilateral and rectangular shapes. Measurements of areas shall be horizontal, and each area shall be bounded by land vertical with the horizon. Alluvial mines shall be laid out in the same way a book of record for proclaimed gold districts and for unproclaimed districts in places in which applications for leases of areas are made shall be kept at the crown land office; also a book for prospecting licenses, with particulars of areas applied for, names of applicants, dates of applications, &c. - such books to be open to public inspection. Plans of all gold districts with areas entered thereon and areas applied for shall be kept in the surveyor general's office. All applications for leases of areas shall be made in writing to the surveyor general, accompanied by fee of $2. Whenever any area shall have been leased as herein provided the owner shall on or before the expiration of the first year pay the surveyor general fifty cents for each and every such area or portion thereof and shall continue the same annually. Upon failure to pay these fees in advance the lease shall be declared forfeited. All leases shall be filed in the surveyor general's office. When the holder of a lease of areas on private lands cannot make an agreement with the owner or tenant thereof, for leave to enter, and for easements and any damage to the land and for other purposes, the matter shall be referred to arbitrators. One arbitrator only shall be appointed by the owner and tenant, and if they do not agree in the choice of another, the one chosen by the owner shall be entitled to act. In case the arbitrators do not agree they shall select a third, and failing to agree on a third, he shall be appointed by the warden of the county. The award of any two arbitrators made in writing shall be final. The payment of all damages so awarded shall be made by the lessee or licensee before entry on the lands, but all persons holding title under this act shall, in addition, be liable for all damages that may ensue from the falling in of lands or for other injury for which damages have not been awarded. All leases shall be for 20 years, but the holder can at any time surrender his lease by giving notice in writing. Such leases may be forfeited on failure to pay the stipulated royalties other than those arising from gold and silver bearing material crushed or otherwise treated at a licenced mill, or to keep employed annually on the demised premises the number of days labor hereinafter specified, or to comply with any other of the provisions and stipulations. The governor-in-council may prescribe the number of days labor which any lessee shall be required to perform. Any person occupying and staking off any areas or taking possession of by staking off any areas from the land not lying within any proclaimed gold district not exceeding 100 acres of class No. 1 shall be entitled to a licence or lease as the case may be in preference to any other applicant. Every such person shall be entitled to one week and, thereafter, to twenty-four hours' time for every fifteen miles distance of the mine so staked off from the office of the surveyor general at Fredericton, for making his application. The surveyor general may issue prospecting licenses to search for gold and silver, subject to conditions to be prescribed. Any such licence may include an area, not exceeding 100 acres of class No. 1 laid off in quadrilateral and rectangular figures and shall not in length exceed double the breadth thereof, such licences to be in force not over twelve months. All such applicants shall accurately define the meets and bounds applied for, accompanied by a fee of fifty cents per area for every area up to ten areas in extent, and twenty five cents for every additional area. The applicant shall enter into bonds to recompense the proprietor of the soil for all damages, said damages if not mutually agreed upon to be settled by arbitration in same manner as above prescribed. The holder of a prospecting licence fulfilling all terms and conditions shall be entitled to a renewal thereof for a second twelve months at half the original fees. Within the period for which licence or renewal licence is granted, the holder shall be entitled to select any areas comprised therein, and to lease of same, on terms prescribed by the act. On all leases of gold, and gold and silver mines, and prospecting licences therefor, there shall be reserved a royalty of 2 1/2 per cent upon the gross amount of gold and silver mined. The surveyor general may issue licences to run or use any mill or machinery for reduction or concentration of quartz, etc., and shall retain out of such gold or silver a sufficient amount to cover the royalties prescribed by the act. Machinery or mills worked by hand are exempt from licence. All licences shall enter into $2,000 bonds to comply with all requirements and shall keep a book of account of work done, open at all times to government inspection. Each licensed mill owner shall pay weekly, or otherwise as determined, a royalty of 2 1/2 p.c. on the gross amount of gold obtained at the rate of $19 per ounce, troy, for smelted gold, and $18 an ounce, troy, for unsmelted gold, and of 2 1/2 p.c. on silver at the rate of $1 per ounce, troy. Provisions for the enforcement of the above requirements cover several sections of the act. Five per cent. of the royalty will be returned to licenced mill owners by the government. Lessees of mines shall make to the crown land office within ten days after the first of January, April, July and October, correct returns under oath, as follows: 1. Number of days labor performed during previous quarter. 2. Number of tons of quartz, etc., raised. 3. Name of person to whom same has been sold, with list of lots and dates of disposal. 4. Weight of all quartz, etc., sent during the quarter to any licensed mill; name and description of mill, and weight of each parcel. 5. Yield of each lot or parcel as returned by mill owner, and date of return. 6. Total quantity of gold and silver obtained during the quarter, distinguishing that resulting from crushing at a licenced mill from gold and silver otherwise obtained. Provision is made for the releasing of forfeited areas, and to punish unlawful entry and working. Mines Other Than Gold Mines. - Licences to search for one year, to enter upon any unapplied for lands and to dig and explore, &c., may be issued for one year, bond being given to recompense the land owner for all damage. Each application is to be accompanied by a fee of $20. Search license may cover any single tract of land not exceeding five square miles in extent, but not more than two and a half miles in length. The cost of survey shall be borne by the applicant, who shall make speedy and full returns of the results of his exploration to the surveyor general. Such license may be renewed for twelve months under special circumstances. When a license to search for mines other than gold and silver has been applied for, it shall be lawful for the surveyor general to receive applications for other licenses to search (called second rights) on the same area, provided that he shall receive no more applications than there are areas of one square mile each within the areas so first applied for, and on the expiration of the search licence granted under the first application, or on the selection of one square mile thereunder, the license to search can be granted under the second application, and so on till the whole area is disposed of. The holder of a search license may before its expiration select from the land so covered an area of one square mile for the purpose of working the mines and minerals therein and apply for license to work the same, accompanying the application with a payment of $50, and the surveyor general shall survey and set off the same in one block and grant a license therefor, due bonds being given. Every license to work shall be for the term of two years and shall be extended to three years upon additional payment of one-half the original amount. Any party may apply for a license to work without having previously obtained or applied for a search license, his application to embody a description of the area; and upon complying with the conditions he shall be entitled to a license to work. The holder of a license to work, or those representing him, having complied with the terms, shall on or before the expiration of his license be entitled to a lease of the premises. Leases. - No lease shall issue till the surveyor general is satisfied that the conditions relative to commencement and continuance of effective mining operations in the license to work having been fully complied with. Leases of mines other than gold or silver shall be for 20 years. In granting leases a barrier ten yards wide shall be reserved all around the lease area, not to be opened except by consent of the owner of the adjoining area or the governor in council. In case the land is covered by water the barrier shall be twenty-five yards wide. The transfer of a lease of a coal mine is subject to approval of the governor in council. The governor in council may authorize the granting of a lease of a larger area than one square mile under special circumstances, but in no case to exceed two miles. All existing or future leases of copper and lead mines shall be held to convey all ores and metals associated therewith. All lessees of mining areas other than gold or silver shall place durable posts at each corner thereof. Quarterly sworn returns shall be made by all lessees. Royalties - Coal, ten cents per ton; copper, four per cent. upon every unit, that is upon every one per cent. of copper contained in each ton of 2352 lbs. copper ore, sold or smelted. Lead - Two cents upon every unit, the ton being reckoned at 2240 lbs. Iron - Five cents on every ton of ore. Tin and precious stones - Five per cent. on their value. Coal mine leases hereafter issued shall contain the provision that royalties may be changed at the pleasure of the legislature. All royalties due the province shall bear five per cent. interest. Renewal leases of mines other than gold and silver shall be granted, in all not to exceed eighty years from the date of original lease, bona fide working being in all cases an essential. Provision is made for the surrender of leases at any time, and abandonment for one year, or any colorable working shall constitute ground for forfeiture of lease after due investigation, hearing, etc. The surveyor general can lease crown lands within any proclaimed gold district, or where other mining is going on for purposes other than

Fredericton Daily Gleaner - Mar. 26, 1891 Legislature. - .... Then the bill relating to mines and minerals was brought in by Mr. Blair for its third reading. Mr. Phinney commenced in the afternoon to read it to the committee, section by section. It had little discussion, and that was desultory. In the evening a large number of ladies were present. They could nothave known what was coming or they probably would not have been there. Very few men were present and not more than half the members, but the ladies and newspaper correspondents were assembled in force. Mr. Phinney continued his onerous and unenviable duty of reading the bill, and though it was not very interesting to the female minds, they hung on even when it had got into the nintieths and one hundred and twentieths. Perhaps they lived in hopes of better things to follow. Towards the close Mr. Phinney, who is not in the best of health, had to hand over the reading of the bill to Assistant Clerk Richards. The reading concluded with section 137 at about half past nine with the galleries almost empty. A few amendments of little importance were then introduced into the bill on motion of Mr. Blair. The Mineral Bill. The bill makes some radical changes in the existing provincial mining regulations, and makes them more stringent and effective, The principal clauses are briefly as follows: Mining rights are separate from the soil or property rights but do not hold in the case of surface veins. Neither the surveyor general nor any officers of his department can be interested in mining under penalty of fine of $1,000. Gold And Silver Mines. Gold districts shall be declared uniformly as regards area and plans of such shall be kept in surveyor general's office. Holders of leases shall pay annually 50 cts. for each area of 150x250 ft. If the lesees and owners of areas do not agree as to mining the areas the matter shall be left to arbitrators. All leases shall be for 20 years. Such leases may be forfeited if regulations are not complied with. Any person staking off land that does not lie in the gold districts, shall be entitled to a license in preference to any other applicant. The surveyor general may issue prospecting license for areas not exceeding 160 acres and for time not exceeding one year. The prospector shall enter into bonds to compensate to the owner for damages done to his property. The prospector, fulfilling all terms, can renew his license for another year at half original fees. A royalty shall be charged upon lessees of gold and silver mines of 2« per cent upon gross amounts of mines. Surveyor General may issue licenses to mining mills on condition that they enter into $2,000 bonds to comply with regulations. Lessees of mines shall make returns under oath at the Crown Land office each quarter, of particulars of work done at the mine - days of labor, amount of quartz raised and to whom sold, and the total yield of metal from the mine. Mines Other Than Gold Mines. Licenses to search for one year, to enter upon any unapplied for lands and to dig and explore, etc., may be issued for one year, bond being given to recompense the owner for all damage. Search licenses shall be for twenty years in time and for a tract not exceeding five square miles in extent and shall require a fee of $20. Licenses for working areas of one square mile will be granted by the surveyor general at a charge of $50, bonds being given. Royalties shall be 10 cts. per ton on coal; five cents per ton on iron ore; four per cent on every unit of copper, that is on every one per cent of copper contained in each ton of ore; 2 cts. upon every unit of lead; five per cent on value of tin and precious stones. At about half past ten the bill passed committee and was ordered to be engrossed to come before the house today."

Weekly Record - Fri. Mar. 27, 1891 Mining Leases No lease shall issue till the surveyor general is satisfied that the conditions relative to commencement and continuance of effective mining operations in the license to work have been fully complied with. Leases of mines other than gold or silver shall be for twenty years. In granting leases a barrier ten yards wide shall be reserved all around the lease area, not to be opened except by consent of the owner of the adjoining

area or the governor in council. In case the land is covered by water the barrier shall be twenty five yards wide. The transfer of a lease of a coal mine is subject to the approval of the governor in council. The governor in council may authorize the granting of a lease of a larger area than one sq. mile under special circumstances, but in no case to exceed two miles. All existing or future leases of copper and lead mines shall be held to convey all ores and metals associated therewith. All leases of mining areas other than gold or silver shall place durable posts at each corner thereof. Quarterly sworn returns shall be made by all lessees. Royalties - Coal, ten cents per ton copper, four per cent on every unit, that is upon every one per cent of copper concentrate in each ton of 2352 lbs. copper ore sold or smelted. Lead - Two cents upon every unit, the ton being reckoned at 2240 lbs. Iron - Five cents on every ton of ore. Tin and precious stones - Five per cent of their value. Coal mine leases hereafter issued shall contain provisions that royalties can be charged at the pleasure of the legislature. All royalties due the province shall bear five per cent interest. Renewal leases of mines other than gold and silver shall issue for twenty years on the same terms, and further renewals for like period shall be granted, in all not to exceed, eighty years from the date of original lease, bona fide working being in all cases an essential. Provision is made for the surrender of leases at any time, and abandonment for one year, or only colorable working shall constitute ground forfeiture of lease after due investigation, hearing, etc. The surveyor general can lease crown lands within any proclaimed gold district or where mining is going on for purposes other than mining. The governor in council may make rules and regulations relative to pumping, draining, ventilation, etc. All transfers, bills of sale, mortgages, etc. shall be registered on back of application for mining right in the crown lands office. The provisions of this act wherever practicable shall apply to all existing licenses and all acts inconsistent with it are repealed."

Royal Gazette - May 20, 1891 and Daily Telegraph - May 22, 1891 Province of New Brunswick. -- Synopsis of The General Mining Act, Chapter 16, 54th Victoria. -- Leases for Mines of Gold, Silver, Coal, Iron, Copper, Lead, Tin, and Precious Stones. -- Gold and Silver. Prospecting Licences up to 100 areas, (each 150 feet by 250 feet), issued at 50 cts, an area up to 10 areas, and 25 cts. Afterwards per area, good for one year. These Licences can be renewed for second year, by payment of one half above amount. Leases for 20 years to work and mine, on payment of $3.00 an area of 150 feet by 250 feet. Renewable annually at 50 cts. An area in advance. Royalty on Gold and Silver, 2« per cent. -- Mines, other than Gold and Silver. Licences to search, good for one year, $20.00 for 5 square miles. Lands applied for must not be more than 2« miles long, and the tract so selected may be surveyed on the Surveyor General's order at expense of Licensee, if exact bounds cannot be established on maps in Crown Land Office. Renewals for second year may be made by consent of Surveyor General, on payment of $20.00. Second Rights to Search can be given over same ground, subject to party holding first rights, on payment of $20.00. Leases - On payment of $50.00 for one square mile, good for two years, and extended to three years by further payment of $25.00. The lands selected must be surveyed and returned to Crown Land Office. Leases are given for 20 years, and renewable to 80 years. The Surveyor General, if special circumstances warrant, may grant a Lease larger than one square mile, but not larger than two square miles. -- Royalties. Coal, 10cts. Per ton of 2,240 lbs. Copper, 4 cts. On every 1 per ct. in a ton of 2,352 lbs. Lead, 2 cts. On every 1 per ct. in a ton of 2,240 lbs. Iron, 5 cts. Per ton of 2,240 lbs. Tin and precious stones, 5 per ct. of value. -- Applications can be filed at the Crown Land Office each day from 9.30 A.M. to 4.30 P.M., except Saturday, when Office closes at 1 P.M. L.J. Tweedie, Sur. Gen."

Royal Gazette - Nov. 11, 1891 Notice of Granting of Letters Patent. Public notice is hereby given, that under The New Brunswick Joint Stock Companies' Letters Patent Act and Amending Acts, Letters Patent have been issued under the Great Seal of the Province of New Brunswick, bearing date the sixth day of November, A.D. 1891, incorporating Robert McNaughton, of Truro, in the Province of Nova Scotia, miner; Alfred Chilton Blair, banker; Thomas B. Blair, Andrew Blair, Allison Wishart, accountant; Arthur McDonald, bank teller; Samuel Girvan, Herbert E. Wardroper, John H. Clarke, A.B.

Clarke, William H. Stone, Joseph R. Stone, express agent; J. Gordon Forbes, barrister-at-law; J. Fenwick Fraser, gentleman; John Connor, merchant; James Straton, barrister-at-law; Arthur I. Trueman, barrister-at-law; William Pugsley, barrister- at-law; and J. Douglas Hazen, barrister-at-law; all of the city of Saint John, in the Province of New Brunswick; for the purposes of the mining, milling and developing of Gold mining on their properties, and the acquiring, buying, leasing and holding of real estate, with such plant, machinery and property as may be necessary or convenient for all the purposes of successfully prosecuting that object; to be called The McNaughton Gold Mining Company, (Limited), with a total capital of sixteen thousand dollars, divided into sixteen thousand shares of one dollar each. Dated at the office of the Provincial Secretary, at Fredericton, the sixth day of November, A.D., 1891. James Mitchell, Provincial Secretary."

Royal Gazette - Oct. 7, 1891 Notice. Notice is hereby given, in pursuance of the provisions of The New Brunswick Joint Stock Companies' Letters Patent Act, of the intention of the undermentioned applicants for Letters Patent for incorporation under the said Act, as follows:- 1. The proposed corporate name of the Company is The McNaughton Gold Mining Company. 2. The object for which incorporation is sought is the mining, milling and developing of Gold Mining on their properties, and the acquiring, buying, leasing, and holding real estate, with such plant, machinery and property as may be necessary or convenient for all the purposes of successfully prosecuting that object. 3. The Company's office and chief place of business is to be in the City of Saint John, in the city and county of Saint John. 4. The amount of capital stock is to be $16,000. 5. The number of shares is to be 16,000, and the amount of each share $1.00. 6. The names, addresses and calling of each of the applicants are as follows:- Robert McNaughton, of Truro, Nova Scotia, miner; J. Gordon Forbes, Saint John, N.B., barrister-at- law; A. Chilton Blair, do. banker; Allison Wishart, do. accountant; J. Douglas Hazen, do. barrister-at-law; Arthur I. Trueman, do. do. John Connor, do. merchant; Joseph R. Stone, do. express agent; James Straton, do. barrister-at-law; Arthur McDonald, do. bank teller; J. Fen. Fraser, do. gentleman; of whom Robert McNaughton, J. Gordon Forbes, A. Chilton Blair, Allison Wishart, and J. Douglas Hazen, are to be the first or Provisional Directors of the said Company. Dated at the city of Saint John, in the Province of New Brunswick, this tenth day of September, A.D. 1891. J.G. Forbes, Sol. for applicants."

Daily Times - Oct. 15, 1891 The Mining Act. - We observe that the Honorable (so called) L.J. Tweedie is holding court to consider claims under the new provincial mining act. We think it a duty to suggest to parties interested, the owners of ground containing or supposed to contain minerals, that they will do well to keep a sharp eye on the operations of this court and on the working of the act generally. The very arbitrary power it gives to lessees to enter upon other people's lands may lead to gross abuses and is of very doubtful propriety in this country. Besides there seems reason to fear that the new law was designed for the benefit of the few and not the many and that the love of boodle, which is the root of all political evil, was the moving cause of its enactment. It will pay to watch its working closely and in some cases it may pay to employ counsel to defend the rights of owners. Eternal vigilance and some expense is often the price of liberty and justice and unfortunately in this case no one can rely upon integrity and honesty in the administration of any law or regulation by the present government of this province. Watch them!"

Weekly Record - Fri. Oct. 16, 1891 Notice is given in the Royal Gazette that incorporation will be asked for The McNaughton Gold Mining Company. The company's office and chief place of business is to be in the city of St. John; the amount of capital stock is to be $16,000, the number of shares isto be 16,000, and the amount of each share 1.00. The applicants are: Robert McNaughton, of Truro, N.S., J. Gordon Forbes, A. Chilton Blair, Allison Wishart, J. Douglas Hazen, Arthur I. Trueman, John Connor, Joseph R. Stone, James Straten, Arthur McDonald, J. Fen. Fraser, of St. John, of whom the first five are to be the first or provisional directors of the said company. The mines of the company are in Antigonish,

Daily Transcript - Oct. 21, 1891 New Brunswick Royalty on Mines. - For the benefit of our readers who are not familiar withNew Brunswick mining laws we print a comparison between the royalties levied in New Brunswick and Nova Scotia. New Brunswick Gold and Silver … 2 « per cent. Coal … 10 cts. Per ton of 2240 lbs. Iron … 5 cts. Per ton of 2240 lbs. Copper … 4 cts. On every 1 per cent, in a ton of 2352 lbs. Lead … 2 cts. On every 1 per cent, in a ton of 2240 lbs. Tin and precious stones …. 5 per cent of value. Nova Scotia Gold and Silver … 2 per cent. Coal … 7« cts. Per ton of 2240 lbs. Iron … 5 cts. Per ton of 2240 lbs. Copper … 4 cts. On every 1 per cent, in a ton of 2352 lbs. Lead ... 2 cts. on every 1 per cent, in a ton of 2240 lbs. Tin and precious stones ... 5 per cent of value."

Codes: LEGI / IDX_Names: Legislation, etc.;
Evening Gazette - Oct. 23, 1891 Mining Rights. - Surveyor-General Tweedie held court at Sussex yesterday, for the purpose of hearing evidence on certain applications made for licenses to search for mines. One of the applications was from Mr.Alfred Markham, who applied for a license to search a certain tract of land five miles square in which was included the manganese mines of the Pope Manganese Company and lands owned by John Lisson, Richard Lisson, Thomas Lisson, Thomas Williams and Thomas Crawford. Mr. C.N. Skinner appeared on behalf of the manganese company to resist the application. Hon. A.S. White and Mr. George Fowler represented the other owners. Mr. J.R. Armstrong looked after Mr. Markham's interests. Mr. Skinner protested against Mr. Markham being granted a license to search the land occupied by the company on the ground that it was now and had been for years used for mining purposes. Mr. Markham thereupon withdrew his application in so far as it referred to land occupied by the manganese company, but pressed his claim for a license to search the rest of the tract mentioned in his application. The five owners, named above, were put on oath and

testified that at times they had prospected and searched for minerals on their lands, and hoped to develop them themselves. The surveyor-general will make his recommendations to the governor in council as to whether or not the license should be granted."

Daily Times - Sep. 4, 1891 Licence to Search. - Mr. J.W.Y. Smith of Dorchester has been granted a licence to search, work and prospect for minerals under the general mining act on lands described as follows: Beginning on the westernbank or shore of Scadouc River near its mouth, at the northeast angle of lot no. 5, granted to Thos. H. Smith; thence running by the magnet east 2 miles, south 2« miles, west 2 miles, north 2« miles to place of beginning."

Weekly Record - Fri. Sep. 11, 1891 To the Producers and Land Owners in the Province of New Brunswick At the request of many of the land owners of the county of Kings I send you a copy of the act that was passed and especially confirmed and ratified, and finallyenacted by an order of Her Majesty in Council, dated the twenty-fourth day of September 1855, and published and declared in the province the thirty-first day of October 1855. Anno Decimo Octavo Victoriae Reginae. Chap. LXXVI. An act relating to Mines and Minerals. 1. Right of mining vested in the owner of the soil. 2. Governor in Council authorized to grant licenses under regulations. 3. Exemptions from operations of Act. 4. Suspending clause passed April 12, 1855: Whereas it is only just and proper that all Mines and Minerals of every description should pass with the soil to the grantee of the crown, and be vested in him:- 1. The exclusive right of digging and raising Coal or other Minerals shall be vested in the owner of the land wherein such Coal or Minerals is found to exist; but before he shall dig or raise such Coal or Mineral he shall obtain License therefore from the Governor in Council. 2. The Governor in Council may issue a license to the owner of any land, or his assignee, for that purpose, to dig and raise Coal and other Minerals therefrom, upon such terms and on such payment of such rent or royalty, and subject to such rules and regulations, as the Governor in Council may prescribe. 3. This act shall not affect, impair or interfere with the rights or duties of any license acquired under any license granted before it comes into operation, nor with any grant in which the Minerals are not reserved. 4. This act shall not come into operation until Her Majesty's Royal approbation be thereunto had and declared. (This act was specially confirmed, ratified, and finally enacted by an order of Her Majesty in Council, dated the 24th day of September 1855, and published and declared in the Province the thirty-first day of October 1855.) You would imagine that the legislative body that meets at Fredericton, from their acts, consider that the farmers and producers were gentlemen of leisure and possessed of considerable surplus wealth. They, through L.J. Tweedie, sur-general, cited some of the farmers to appear at Fredericton on the fourth day of September at 10 o'clock a.m., to show cause why a License to search should not issue to Alfred Markham under the general Mining Act of 1891. What right have they to ask people to spend their valuable time and money in going to Fredericton to tell them there was an act passed in 1855, granting and giving to the owners of the soil the absolute right to dig and raise all minerals on land or lands owned by them previous to 1891? If the act of 1855 can be repealed and anulled what good is the act of 1891? Do the men who repudiate a contract think the men who invest their capital in the development of a country are fools? What security has any person in the province of New Brunswick, to land purchased by them, when a legislative body can pass an act and make them sell it to private individuals, aliens as well as British subjects, at the price set upon it on the judgement of arbitrators, independent of the landowner thereof? For example M. applies for a mining license, gets the same, calls upon the owner and demands to know his price upon the land he intends to take for mining purposes. The owner refuses to set a price or asks more than M. wants to give. M. goes to the warden of the municipality and makes oath and states his case. The warden if satisfied can appoint an arbitrator to act for the owner, section 18, page 9, Act relating to Mines and Minerals 1891. Further on in the same act section 19, page 10, is the following:- In estimating such damages the arbitrators shall determine the value of the lands irrespective of any enhancement thereof from the existence of minerals therein. Has the autocrat of Russia been breathing into the nostrils of our representatives, or have they become dizzy from being clothed with temporary authority? The farmers of the province will do well to look into these matters more closely and elect some cooler heads possessed with less self esteem, and with your kind permission I will in a future early issue of the RECORD point out some of the stupid nonsense enacted in the Act relating to Mines and Minerals, A.D. 1891. The act quoted in the first part of this correspondence can be found on page 171 Acts of the General Assembly, passed in March, April and May in the year

Royal Gazette - Apr. 13, 1892 Passed Apr. 13th: An Act to amend The General Mining Act."

Daily Telegraph - Apr. 22, 1892 Application for Mining Licenses. - Five applications have been made by the provincial government to search in Westmorland (three by one person) and one in Albert county. A prospecting license has been applied for in Westmorland."

Codes: LEGI / IDX_Names: Legislation, etc.;
Royal Gazette - Aug. 24, 1892 Renewal of Mining Licenses. Crown Land Office, 17th August, 1892. Notice is hereby given to all persons requiring Renewals of Licenses to Search, that a Petition must be presentedto the Surveyor General, in accordance with section 85 of the General Mining Act, setting forth the grounds for making Renewal, together with a statement of what searching or work has been done within the term of the License. All Petitions to be accompanied with a deposit of $20 for every application. L.J. Tweedie, Sur. Gen."

S.J. Daily Sun - Mar. 4, 1892 Legislature. - ..... He (Stockton) could not congratulate the government upon the effect of the mining law. One of the principles underlying that act was unjust. When the bill was going through the house he (Stockton) had asked the attorney general if it referred to manganese and gypsum, and the latter said that it did not, but scarcely had the house adjourned before applications were made from different quarters for areas covering manganese and gypsum licenses. The act might not, in the terms, include gypsum and manganese. But the moment a licence was granted for mining purposes the land was destroyed as far as mining was concerned for anything else. It had always been understood in the country that if a man owned land in fee and there was a mine on it, he had the prior right to mine that mineral. While the language of the speech did not expressly say so, the intention of it was to create the impression that a great impetus had been given to the mining industry. Remedial legislation should at once be adopted. ....."

Kings County Record - Mar. 4, 1892 ... Mr. Blair ... it would be impossible for him to carry it unless he repealed the Mining Act and makes some changes in the stumpage deal. While we are inclined to be friendly to the local government, we drawthe line at the stumpage deal and the Mining Act, these are two things that we cannot swallow and we do not believe that should the constituency be opened; that the government could carry it. We would suggest in a friendly way to Mr. Blair that he take in consideration the wishes of the people, repeal the Mining Act, give Mr. Tweedie the bounce and have a good spring house cleaning ..."

Weekly Record - Fri. Mar. 4, 1892 TO THE EDITOR OF THE RECORD There is one journal in the Dominion of Canada that has escaped the fate of being muzzled, and which will publish information for the farmer without fear or favor from any political party in or out of power, and that journal is the Weekly Record , of Sussex, Kings Co., N.B. The general Mining Act, passed the 10th of April, 1891, stands as is, is an insult to the farmers and land owners of the province of New Brunswick. Upon its fact it shows and advertises to the world that the gentlemen who passed it are possessed of a superabundance of gall, and have no confidence in the independent electors. Sect. 17 of said act gives the owner and tenant the right to spend his time and money to lay complaint before a judge of the supreme court, and if the same is substantiated shall declare the lease forfeited. The said owner or tenant shall pay out his money and receive nothing in return for the same, showing the generosity of our overwise legislators. Sect. 18 compels the owner of the land to give a mining lease to aliens as well as to British subjects, and if he does not do it freely they will do it for him. Will civilized, intelligent farmers submit to such an indignity when Her Majesty in Council made them the absolute owners of the mineral rights? It is well understood that two-thirds of the Hon. gentlemen did not know the act of 1855 was in existence. We will give them the benefit of the doubt. Had they been aware of the fact they would not have insulted Her Majesty by passing the act of 1891. Sect. 19 displays a glaring injustice. No matter how rich the mine may be the owner of the land shall receive no benefit from the same, but shall be compelled to take whatever the arbitrators may give him, in estimating the damage to the land from mining. Work shall determine the value of the land irrespective of any enhancement thereof from the existence of minerals thereon. You would be or are compelled to think that farmers or land owners are dogs and have no individuality. Farming should be considered one of the first industries and be respected as such. It certainly ranks with the noble profession called Law. Sect. 81 and 82 gives the right to lock up 5 square miles for one year for the enormous sum of $20. What lambs the land owners must be, the said land owners receiving nothing for the lock up. How generous are they who give their neighbors rights away, it may be the force of habit, the givers are principally lawyers. The profound wisdom of the province will meet soon, and it is be hoped they will convey to the owners of the soil what justly belongs to them and show a little gratitude for their exalted political positions. It is most wonderful how the world continues when one of its inhabitants is snuffed out, and I think if the legislators of the province endeavor to enforce the General Mining Act of April 10th, 1891, they will be very much like penny dips suddenly snuffed out. No offence. Yours, etc., Wm. Goodfellow. March 1st, 1892."

Daily Times - May 7, 1892 To Search For Minerals in Westmorland and Albert. - Applications have been made to the Surveyor General for licences to search for minerals in Westmorland and Albert as follows: John M. Beaton, Severe Legere and Bliss Thibideau, of Moncton - Begin at northern bank or shore of Petitcodiac River, at the S.W. angle of lot No. 2 granted to Christian Steiff, at mouth of Hall's Creek; thence running by the magnet north 1 5/8 miles, E, 2« miles, S. 2 miles, W. 2« miles, N. 3/8 of a mile to beginning - 5square miles. W. Freeze Wortman, A. Wortman Wilmot and A. Henry Chandler - Beginning at the point of intersection of the eastern bank or shore of Memramcook River with the northern side of Rockland Bridge, thence running by the magnet west 1¬ miles, N. 2« miles, E. 2 miles, S. 2« miles, W. ¬ of a mile to beginning. - 5 square miles. Philip J. Palmer, - Beginning at a point distant 2 miles, on a magnetic west course from the point of intersection of the Nn. side of Rockland bridge with the En bank on shore of Memramcook River; thence from first aforesaid point running by the magnet south 2« miles, W. 3 miles, N. 2« miles, E. 2 miles to beginning. - 5 square miles. Philip J. Palmer - Beginning at a point where the northern side of Rockland bridge intersects the En bank or shore of Memramcook river, then running by the magnet south 2« miles, W. 2 miles, N. 2« miles, E. 2 miles to beginning. - 5 square miles. Philip J. Palmer - Beginning at a point where the northern side of Rockland bridge, crossing Memramcook river, intersects the En bank or shore of said river; thence running by the magnet east 2 miles, S. 2« miles, W. 2 miles, N. 2« miles to beginning. Excepting a Mining Licence heretofore granted by the Crown to Elmer P. Howe, dated 16th December, 1881. - 5 square miles. Joseph M. Robinson, Albert - The 100 acres of land owned and occupied by applicant, being part of grant to James Wright, east of Saw Mill Creek. - 1 square mile."

S.J. Daily Sun - Jan. 10, 1893 Manganese Leases. - The following explains itself: Crown Land Office, Fredericton, N.B., 22nd Dec.By authority of Chap. X, 55 Vic. (Sec. 3), the followingregulations are made to govern applications to mine manganese on granted lands: That upon application, leases to mine manganese, be granted for ten years (without first procuring a license to search) to owners of farm lots at the annual rental in advance of five dollars for every 100 acres. Also the manganese leases for tracts not exceeding one square mile be granted to the owner of the soil for a period of ten years, on payment of an annual rental in advance of twenty-five dollars. Before a lease is granted, a survey of the land applied for must be made, and a return thereof forwarded to this office. When an application is made by a person other than the owner of the land, to mine manganese, and who is unable to arrange with said owner, the surveyor general may notify said owner he must, within thirty days, shew cause why such an application should not be granted, and if good cause be shown, then the surveyor general may require the owner of such land to take out a lease, and on failure to do so within the time prescribed by the surveyor general, a lease may issue to the applicant. L.J. Tweedie, Surveyor General."

Moncton Transcript - Jan. 5, 1894 and Daily Times - Jan. 6, 1894 Application has been made to the Crown Landoffice, dated Nov. 14th, 1893, by Chapman and Steeves and Irving W. Binney, of Westmorland Co. to search forminerals under the General Mining Act ; the situation beginning at the N.E. angle of a 200 lot, granted to Gabriel LeBlanc, in the Second tier, Tedish River; thence running by the magnet South 2 miles, West 2 1/2 miles, North 2 miles, East 2 1/2 miles, to beginning. Being lands between the Tedish River and Kouchibouguac River and 3 miles back from Gulf shore."

Gazette - Dec. 10, 1897 Incorporated. - Letters patent have been granted incorporating Alexander Walker Ogilivie, of the City of Montreal, in the province of Quebec, Senator, William Lovitt Hogg, of the same place, Manager of the Investment Company, W. Barclay Stephens, of the same place, Manager of the Western and Trusts Company, (Limited), Clarence C. Richard Gillard, of the same place, Medical Doctor, Charles Hocore Catelli, of the same place, Manufacturer, John Alexander McGilvray in the State of New York, capitalist, Frank Baird of the city of Saint John in the province of New Brunswick, broker, Thomas Bell, of the same place, merchant and Edward P. Raymond, of the same place, Barrister-at-Law, under the name of the C.O.D. Mining Company Ltd. They will carry on a general mining business in New Brunswick and the Dominion of Canada. The total capital is $300,000 in shares of one dollar each."

St. Andrews Beacon - Feb. 25, 1897 Crown Land Report. - ....Under the GeneralMining Act 34 licenses to search, covering 157 1/4 square miles were issued; of this number 5 were in Charlotte, covering 18 1/4 square miles. One prospecting license was issued in Charlotte, embracing 20 acres. The report says that negotiations are now going on for the purchase of a first class diamond borer. Several applications for its use have already been received."

Weekly Record Fri., Jul. 22, 1898 Re Question of Our Mining Laws - To the Editor of the RECORD - Sir - I notice in your issue of the 8thinst. the letter of Mr. Keith relative to the finding of gold in New Brunswick, which paragraph I believe I furnished for the RECORD at the time, also his remarks concerning our mining laws. For the information of Mr. Keith and his friends I would like to say that the mining laws of N.B. some few years ago were changed materially, and a mining act passed which is in effect somewhat similar to the Nova Scotia mining law. While at present it is not all that it should be and will no doubt in time be amended so as to make it more available, yet under present conditions men wishing to engage in mining can do so on fairly reasonable conditions. Royalties of 2 1/2 per cent. on gold and silver, 12 cents per ton on coal and 5 per cent. on value of copper, lead, iron, tin, etc. are in force. On gold and silver the Government issues prospecting good for twelve months on payment of 50 cents per area for first 10 areas and 25 cents per area for additional areas up to 100. Each area contains 150x250 feet; thus at a cost of $27.50 a man can acquire twelve months right of search on 100 areas or equal in extent to about 87 acres, or take any lesser number of areas he wishes at above rates, and if at the end of twelve months, or before, he finds he has a sufficiently good show he can apply for and secure a lease good for twenty-one years by paying $2.00 per acre for such areas as he may take up. If he works his property he is not subject to rental. If he does not work it, by paying an annual rental of 50 cents per area each year he can keep his lease good. The royalty payable on gold and silver, 2 1/2 per cent. on dollar and that on other minerals is, however, not collected for a term of five years, giving parties opening up a mine and putting in plant a fair show. On mines other than gold and silver - say copper, iron, lead, tin, etc. - a right of search for eighteen months on payment of fee of $20.00 can be had over five square miles, giving the prospector first right within the eighteen months to locate one square mile or 640 acres on which, on payment of a reasonable fee, he can secure a twenty year renewable lease. In both cases, where mines are found on other than crown lands, owner of land can claim surface damages from miner and in case he and the miner cannot agree the law provides for an arbitration, which decision is final and binding on owner of land. So it will be seen that the mining law at present pending is not too bad for those who really mean business, have capital and can locate satisfactory claims. Mr. Keith or any of his friends can obtain copies of the N.B. mining law by applying to Hon. A.T. Dunn, Surveyor General's office, Fredericton, N.B. If the friend he speaks of knows there is a mineral belt in N.B. of workable size, containing ore that will yield $110.50 per ton in gold and silver, he is mighty foolish in spending all his time in British Columbia and I would advise him to avail himself of the advantages of our present mineral laws, imperfect though they may be in some particulars, and come back to N.B. for a time and open up the Bonanza and do what he can to develop our resources and I am sure he will receive all the assistance from the Crown Land Department, which controls minerals, that any one can possibly wish for. Trusting this may present itself favorably to Mr. Keith and his friends, I am sir, Yours Faithfully, X -

Kings County, N.B., July 14, 1898."

St. Croix Courier - Jan. 30, 1902 Looking For Minerals. - Geo. M. Hanson, M.N. McKusick, C.B. Gardiner and F.W. Hinckley, all of Calais, have made application to the crown land department at Fredericton for license to search for minerals on two lots of land in Charlotte county described as follows: 'Beginning at S.E. angle of License to Search, No. 303,west of Dennis River, thence running by the magnet of the year 1902, North 2 1/2 miles, East 2 miles, South 2 1/2 miles, West 2 miles to beginning.' 'Beginning at a point where the Washington County Railway intersects the En. bank or shore of River St. Croix at Sprague's Falls, thence running by the magnet of the year 1902, East 2 1/2 miles, South 2 1/2 mile, West to and up River St. Croix to beginning.' Thaddeus Dick has made application for a license covering a lot described as follows: 'Beginning at the most Sn. end of Bean's Island, opposite the entrance of Lord's Cove, Deer Island, thence running by the magnet of the year 1902, West 1 mile, North 2 1/2 miles, East 2 1/2 miles, South 2 1/2 miles, West 1 1/2 miles to beginning. Excepting all those parts of Mining Leases, Nos. 22 and 23, contained within the above described

N.B. Reporter - Jul. 30, 1902 Letters patent have been issued under the greatseal of the province, incorporating Samuel Winter, William Christie, James McD. Cooke, Gurney R. Jones, Andrew H. Jones, and Albert H. Riley, all of New York as the 'British Mica Company Limited'. The object of the concern is to acquire, own, and operate mining property in New Brunswick, and also in the Caribou district of British Columbia. The total capital stock is to be one million dollars, divided into ten thousand shares of one hundred dollars each."

St. Croix Courier - Mar. 27, 1902 The Provincial Budget Speech. - .... Mining Development has gone on steadily in the province since the passage of the general mining act of 1891, but the province has never been properly prospected. Much of the work that has been done by the geologists has been theoretical rather than practical. It will be the policy of the government to get over this difficulty and without going to any very large expense to have a careful examination made of the various minerals resources of the province, so that they may be properly utilized. A great deal has been done recently in regard to oil developments. This province is a difficult one to prospect, because of its being so heavily timbered, but for the future the government will see that this work is properly done. ..."

Weekly Record - Fri., Apr. 10, 1903Applications for incorporation has been made to the provincial legislature, by Arthur I. Trueman, barrister, of St. John; James Robinson, lumber merchant,of Millerton; William H. White, insurance agent; William Pugsley, barrister; and William A. Ewing, barrister, of St. John. The name of the company is the Princess Royal Gold Mines Ltd. The capital stock is $1,250,000. The objects of the company are to purchase, and acquire mines, mining areas, licenses, and leases, also to carry on business as general merchants and traders. The chief place of business is

Weekly Record - Fri., May 22, 1903At a meeting of the Princess Royal Gold Mines, Limited, held at Rothesay, yesterday, the company was duly organized. The directors elected are Hon. Wm.Pugsley, Judge A.I. Trueman, Wm. H. White, James Robinson, M.P., and Wm. A. Ewing. Reports were read, showing most satisfactory progress in working the mines. The shipment of ore will probably be made early in June. At a meeting of the directors, Hon. Wm. Pugsley was elected president, Wm. H. White, vice president; Judge Trueman, treasurer, and W.A. Ewing, secretary. - Tuesday's Telegraph."

St. Andrews Beacon - Jul. 6, 1905 C.L. McKeen, of St. Andrews, has been granted a license to search for minerals near Lepreaux. It is understood it is coal he proposes searching for. A.H. and A.F. Worden have been granted a license to search in Charlotte and Queens."

St. Croix Courier - Jun. 13, 1907 William Henry and George M. Hanson have been granted license to search for minerals on land extending from the St. Croix river out along the line of the Basswood Ridge road."

Woodstock Despatch - Jun. 26, 1907 Mining licenses have been granted to the following Carleton county men: John J. Rogers, Harry G. Noble, P.T. Kierstead, E.R. Teed, A.B. Connell, Frank McClement, B. Fred Smith."

St. Croix Courier - Mar. 21, 1907 Looking For Minerals. - Wm. Hanay, L.E. Foster, E.J. Sawyer and Geo. A. Sawyer have applied to the crown for license to search for minerals on land described as follows: 'Beginning at N.E. angle of Lot No. 1, granted to L.E. Faxen, on E. Branch, Seal Brook, thence runningby the magnet of the year 1907, South 1¬ miles, West 2 miles, North 2« miles, East 2 miles, South 1 miles to beginning.' Geo. J. Clarke, D.H. Ferguson, Chas. Steenheim, L. Ederheimer and Geo. M. Hanson want a similar license on land described as follows: 'Beginning at N.W. angle of Lot letter C, granted to Peter McCallum at Moore's Lake, thence running by the magnet of the year 1907, West 2« miles, North 2 miles, East 2« miles, and South 2 miles to beginning.'"

St. Croix Courier - Feb. 6, 1908 After Minerals. - Geo. M. Hanson, Chas. Sternham and C.B. Gardner have applied to the New Brunswick government for license to search for minerals on landdescribed as follows: Beginning at N.W. angle of lot No. 6 granted to James Murchie, in the Second Tier, East of the road from Little Falls, through Porter Settlement, south of Mud Lake, thence running by the magnet of the year 1900, North 2 miles, East 2 1/2 miles, South 2 miles, West 2 1/2

Codes: LEGI / IDX_Names: Legislation, etc.;
Campbellton Graphic - Feb. 22, 1910 Prospecting. - Notice of application for no less than twenty five licenses to search for minerals appearsin the last issue of the Royal Gazette. Most of the applicants are from the counties of Gloucester, Northumberland and Restigouche."

Campbellton Graphic - Jun. 3, 1910 Mining Investigations. - Surveyor General Grimmer expects to go to Bathurst this month to continue the hearing of the several investigations regarding themining claims which were commenced last winter during the session of the Legislature."

St. Croix Courier - Sep. 29, 1921 Surveyor General Tweedie came to town on Friday and spent the afternoon and evening in examining the claims of the different applicants for mining licenses throughout the country. The investigation was held in theoffice of F.H. Todd & Sons, which was filled during the progress of the hearing with an anxious crowd of prospective miners and their counsel. Two or three applications were withdrawn. Decision concerning the others will be rendered in due

Evening Times Globe - Mar. 8, 1928 Development in N.B. Mining Has Increased. - Deputy Minister Prince Submits Report to Legislature. - Fredericton. - March 7 - Increased mining development in New Brunswick has followed new legislation passed at the 1927 session of the Provincial Legislature when the 'mining law was brought up to the standard of the mostadvanced provincial mining legislation in the Dominion, in order that prospecting might be encouraged and development stimulated,' says Deputy Minister of Lands and Mines, G.H. Prince, in dealing with the mining industry in the 67th annual report of the Department of Lands and Mines tabled in the Provincial Legislature here today by Hon. C.D. Richards. 'Under the new mining law,' says the deputy minister, 'the prospector has a fair field, is free from unnecessary restrictions and will be able to lay hold on what he has found with certainty of tenure. The whole Act is aimed to assist the agressive location and development that New Brunswick mineral resources deserve. This Act has received very general commendation, and has succeeded the one it replaced without any friction or difficulty. 'There have been greatly increased activities in the investigation of the metallics of the province, chiefly in antimony, copper, iron, zinc and lead, and it is expected that much actual development will take place in the present year. The valuable deposit of antimony at Lake George is now being developed, and gives promise of great importance in the future of the antimony industry. The several copper occurrences found in different parts of the province, and which up to the present have been only partially explored, warrant further investigation with a view to development and the attention is now being given in several locations. It is also anticipated that the large resources of iron ore in the vicinity of Bathurst will some day be used for the production of sponge iron. Lead and zinc ores are now also being investigated, and we look forward with confidence to great progress in the mining industry in New Brunswick. The deputy minister's report refers to the fact that mining of coal, gypsum, gas and oil has continued regularly during the last year, the production being somewhat greater than in the preceding year. The production of oil was the greatest that 'has ever taken place since the fields were opened,' says the report."

Evening Times Globe - Mar. 8, 1928 In Legislature. - ..... (M.E. Agar on mineral resources) .... He was glad that steps had been taken with a view of developing the mineral resources of the province. It would have a tendency to create a spirit of optimism among the people, and would undoubtedly serve a good purpose in other ways. There were many reasons why New Brunswick should be appreciated more than was actually the case. It was possessed of good climate, capable of developing a strong and healthy people. The province was free from many of the disadvantages of other countries. ...."

Evening Times Globe - Mar. 9, 1928 Legislature. - Lt. Col. Harrison (says on mineral resources) ..... The budget had appropriated $14,000 for mining, and he was glad to know that capital was coming in for development. He thought the appointment of aprovincial mineralogist was a necessity. We had been informed by Mr. Price Green that some of our geological formations were most promising. It was first necessary to find the minerals before we could safeguard them, as suggested by his honorable friend from Madawaska."

St. Croix Courier - Apr. 8, 1954 Mines Minister Introduces New Mines Tax Bill. - Fredericton - A Provincial Tax ranging from seven to nine per cent on mining operation profits above $10,000 is provided for in legislation submitted to the Legislature here Tuesday. Under the Mining Tax Act Bill, introduced byLands and Mines Minister N.B. Buchanan, of St. Stephen, the first $10,000 operational profits are exempt from taxation. On profits over $10,000 and up to $1,000,000, the tax rate is seven percent, while the rate is eight percent on profits over $1,000,000, but not exceeding $5,000,000. On profits over $5,000,000 the rate in nine percent. May Be Increased. - The Bill also provides that the location of every smelter, mill or refinery shall be 'chosen, determined or approved by the Lieutenant Governor in Council', and that if ore is shipped outside the Province for treatment the taxes otherwise payable may be increased. Provision is made for the mine operator to appeal to the Minister and if still unsatisfied to the Courts. No Interference. - Mr. Buchanan explained the New Act does not interfere with the provisions of the present royalty legislation, which covers coal, gas and oil only. The new legislation defines 'mining operations' as the extraction of mineral ore from a mine, and specifically excludes coal, limestone, granite, marble, gypsum and sand. Taxes assessed under the Act are allowed as expenses in computing Federal income taxes, as the Province has the right under the 1952 Dominion-Provincial tax rentals agreement to tax profits from mining operations."

Codes: LEGI / IDX_Names: Legislation, etc.;
Kings County Record - Oct. 7, 1954 ADVERTISEMENT: Notice to Holders of Mining Claims in New Brunswick Mining claims recorded prior to the first day of November, 1953 are subject to renewal as of October 31, 1954. Mining claims recorded on ar after November 1, 1953 are subject to renewal twelve months from the date of recording. Mining claims shall not be valid for more than 48 months from the date of recording. To renew mining claims the holder should: (1) Make application to the Recorder; and (2) Pay the renewal fee of $1.00 per claim; and (3) Report assessment work at the rate of 25 man days' work per claim per year. Thus if claims were renewed in October, 1953 and no work was reported it will be necessary to report 50 man days' work per claim. Thereport must be on Form L., as prescribed in the Mining Act. Work may be performed on one or more of a group of contiguous claims. Mining Claims may be renewed even though all required work was not performed. In this regard consideration will be given to claim holders who (1) have performed a substantial amount of work, (2) the work is still in progress, (3) a firm commitment is given that the requisite work will be completed in continuous performance. In the case of a claim holder who has performed no work claims will not be renewed. Attention is directed to the following: Regulations Governing Certain Work On Mining Claims and Mining Licenses. Subject to the conditions outlined below the Minister of Lands and Mines will accept as work on mining claims or mining license under the Mining Act, drilling, surveying, geological, geophysical or geochemical surveys, and special work such as the use of bulldozer or equipment driven by compressed air or other mechanical power. Conditions. 1. Form L, 'Mining Act' - The nature of the work must be clearly detailed on the form. 2. Evidence of Expenditure - An affidavit shall be submitted detailing expenditure for the work. 3. Evaluating Expenditure - Expenditure will be accepted only in respect of costs, fees, salaries, and wages for work performed on the ground. Such payments must be at a rate satisfactory to the Minister. 4.

Nature of the Report - Full reports and plans, satisfactory to the Minister, must be submitted with Form L. 5. Form or Report - (A) Reports filed must be bound in suitable folders of such size that they may be placed in a standard steel filing cabinet. (b) The report must be typewritten on a good grade of bond paper of letter or foolscap size. (c) Maps must be bound in report or inserted in an envelope fastened securely in the folder. (d) The procedure followed in performing work must be clearly indicated. 6. Qualifications - All work must be performed, and report prepared by personnel having requisite qualifications satisfactory to the Minister. 7. Allowance for Work The actual expenditure for work as listed in the first paragraph may be recorded as work at the rate of one day's work for each five dollars spent. Mining claims which have expired shall not be restaked before 8 a.m. on the twenty first day after the date of expiry and shall not be staked by or for the former holder. It will be appreciated if application for renewal be submitted as soon as possible. N.B. Buchanan, Minister of Lands and Mines. September 9, 1954."

Moncton Times - Nov. 3, 1877 Mining Men will be interested in the following notice which appears in this week's Royal

Gazette: - NOTICE Assays will be made at the Provincial Laboratory, Sackville, County Westmorland, for parties residing in the Province of New Brunswick. The charge made will bethe amount expended for the materials used in making the assay, in no ordinary assay exceeding the sum of fifty cents. Prompt returns will be made to parties who forward specimens by mail or express, prepaid, to Sackville, N.B. J. Burwash Oct. 31, 1877 Provincial Assayer"

St. Croix Courier - Feb. 25, 1897 The Crown Land Report. - ..... The receipts under the general mining act also fell off. During 1896 five licenses to search, covering an area of 18 1/4 miles, and one prospecting license, covering an area of 20 miles, were issued in this county. The report states that the government having made an appropriation of $4,000 at its last session for the purpose of purchasing a diamond borer, negotiations are now going on for the purpose of purchasing a first class machine. As several applications have already been made for the use of the machine in various sections, it is hoped that large developments and a renewed interest will be taken in opening up the mineral resources of the province."

Royal Gazette - Nov. 12, 1842 To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, In compliance with Your Excellency's instructions, I haveproceeded to explore the Restigouche River, with some of its tributaries, and the surrounding country, a full account of which will be contained in the general report on the settlement lands. My son ascended the St. John to Madawaska, where he procured provisions, canoe and guides, to enable him to cross the waters of that River, to those of the Restigouche. Having ascended Grand River, and one of its branches to the distance of

twenty miles, the canoe was carried across a portage of three miles, and launched in the Waagan, a tributary of the Restigouche, one hundred and thirty miles from its mouth. A Canal might be opened at a moderate expense in this quarter, to connect the waters of the St. John with those of the Bay Chaleur. I ascended the Restigouche and examined the country on each of its sides, and met the expedition from above a short distance below the mouth of the Upsalquitch. The difficulties of descending from the sources of the river at the present time of the year, are very considerable; as the season has been very dry we were compelled to drag our canoes nine miles along the bed of the upper part of the stream, and so great is the difference of climate in the wilderness, that ice was frozen half an inch in thickness in the upper part of the stream on the 12th of September, while at the mouth of the river no frost had been seen, and luxuriant crops of wheat were in full harvest. We were surprised to observe that the stream which has been generally understood to be the Restigouche, and is so called by the English inhibitants, is only a branch of the Main river. The Main River on some of the maps is called the Cadamkiewa, and Tom Kedgewick. The Indian name in the Micmac language is Pee-tam-kedge-wee. The southwesterly branch of the river above its junction with the larger stream is called by the Micmacs A-waan-jeet. The former stream is one third larger than the latter, and is eighty yards wide where it meets its chief tributary. It may be remarked here that where a river is forked, the Indians give a distinct name to each branch without reference to the name of the stream below. One of the sources of the main Restigouche or Pe-tam-kedge-wee, is near Tamisquata Lake, another approaches the Metis Lake very nearly. If the main Restigouche be the boundary between the Provinces, it will be seen by the reference to a good map, that a large tract of country will fall to New Brunswick, which has heretofore been considered to be on the Canada side; and it will also be seen that the outline of both Provinces will be very irregular and by no means convenient. On the Peninsula separating the River St. Lawrence from the Bay Chaleur, there is a lofty mountainous ridge - a branch of a chain called the Alleghenies, which extend through the United States. It was up to this ridge that the American Government laid their claim before the question of the Disputed Territory was settled, and until that period, the Restigouche formed a temporary boundary between Canada and New Brunswick; but since the happy terminations of that dispute, the range of Mountains separating the rivers that flow into the St. Lawrence, from those that flow into the Bay Chaleur, the Restigouche, and St. John, will in my opinion, form the best divisional line between the Provinces. Such a line would give to each Province all the rivers that flow and open into their respective districts, and would agree with the physical geography of the Country. The Restigouche forms an inconvenient boundary between the Provinces; all the timber cut upon the tributaries of that stream is shipped from Dalhousie and Campbellton on the New Brunswick side. The only land communication between the districts of Gaspe and Quebec, is along the Kempt or Metis Road, where a mail passes once a week. This road has never been opened and improved to any great extent. The Mail carrier rides about sixty miles on horseback, from the Restigouche to the Matapedia Lakes, where he feeds his horse on wild hay, and walks upwards of forty miles, to the mouth of the Metis River. This line of road runs through a very mountainous and broken tract of Country. The opening of a road from Fredericton to some part of the Restigouche is a matter of much importance to the Province. The lower part of the Restigouche is fit for cultivation, and southward of the Pee-tam-kedge-wee, or upper part of the Restigouche, the land becomes level. The soil on the Restigouche is of a good quality and produces excellent crops of all kinds of grain. The Restigouche is navigable for tow-boats andcanoes one hundred and twenty miles from its mouth. The Matapedia is then navigable fifty miles, and the Upsalquitch seventy miles. The district abounds inlimestone and marl, and there is a coal field near Campbellton. In bringing this communication to a close I beg to assure Your Excellency that I shall take the earliest opportunity to make up the general report of the Restigouche, which will include a full account of its minerals and other natural resources. I have the honor to be, Your Excellency's most obedient and very

St. Andrews Standard - Jan. 12, 1839 Geological Society. - The first annual meeting of the Geological and Mineralogical Society took place at their Hall, the President, Dr. Frye, ..?.. The following is the First Annual Report of thePresident and Committee of the Saint Andrews Geological and Mineralogical Society. Geology and Mineralogy as a study possesses ..?... [first 4 paragraphs unreadable] ...And it is due to Dr. Gesner ..?.. that the specimens presented by him were very fine, and that the interest and kindness ..?.. by him for the welfare and prosperity of the Institution entitle him to theconsideration of the Society. Here it may not be out of place to observe that the discovery of marble during his survey of this county is one of great importance to Agriculture and extremely interesting as a geological fact of a peculiar

character indicative of a later formation than the new red sandstone and analagous to, but in some respect differing from the usual marl groups overlying similar formations the greater part of which has yielded to the approaches of the sea. Subsequently to the announcement of this valuable discovery, several members of this Institution have devoted much time and attention to it, and have been fortunate to meet with good beds of marl in various detached situations along the coast and had also made no inconsiderable progress in enquiring a knowledge of the general character the different formations in our neighborhood. This may be regarded as the first trust of our labour, and holds out simple encouragement for perseverance. It is thought, however, that a detail of these ..?.. investigations would be premature especially as an able report embracing a more extended and systematic view of the geology and mineralogy of the County may shortly be expected from Dr. Gesner employed by the Government in a scientific survey of a part of the Province, and from whose reputation and acquirements it cannot be doubted much information will be derived. The following Office Bearers were then chosen for the ensuing year:- S. Frye, President J. Rait } J. Wilson } vice presidents J. Rodger secretary G.D. Street Treasurer C.J. Briscoe } C.V. Foster } T. Sime } Committee J.H. Whitlock } H. Frye }"

Union Advocate - Mar. 17, 1870 Our Minerals and Fossils. - Possibly the accompanying list of Mineral and Fossil localities in the County, may be of service in directing the investigations of amateur Mineralogists and Geologists. It has been compiled from the Reports of Professors Bailey and Hind, and from notes of observations made in leisure hours, by myself, during the past summer.It is only proper to say that the Limestone on the Sevogle, and Hone Stone, at the Tomogonops, occur in vast beds. I have not been able, however, to find that any of the other minerals in the list are in such quantities as to make them of any value, although more thorough examination might show this to be the case. Copper Carbonate. - N.W. Miramichi, near 4 Mullin's, Sevogle. Copper Sulphuret. - N.W. Miramichi, near Mullin's and near Allison's. Gold. - Little S.W. Miramichi, Sand feebly auriferous. Near mouth of Sevogle.(?) Iron (as Red Paint).- N.W. Miramichi, near Mullin's and near mouth of Sevogle. Iron, Oxide. - Derby. Upper Nelson. N.W. Miramichi, near Peabody's. Iron, Arsenate. - Falls of Sevogle. Iron, Bog. - S.W. Miramichi, above Boiestown. Escuminac. Iron, Hematite. - N.W. Miramichi, near mouth of Portage River. Iron, Sulphuret. - Chatham, Newcastle, Boiestown, Sevogle. Manganese, Oxide (Wad). - Derby, Upper Nelson, N.W. Miramichi, near Peabody's. Trout Brook. Hone Stone. - Tomogonops. Limestone. - Sevogle. Royal Gazette - Jul. 1, 1874 CAP. XCVIII. An Act to incorporate the Sussex Lime and Plaster Company.Sec. Sec. 1. Company incorporated. 8. Principal office, 2. Capital stock. where established. 3. First meeting, where held 9. Transmission of and by whom called. interest in share, 4. Liability of shareholder to other than ordinary Company. transfer, how made. 5. Assessments upon shares, 10. Responsibility of how ordered. shareholder for acts 6. Shares not tranferable until of Company. all calls are paid. 11. Company may borrow 7. Annual meeting to be held. money; proviso. 12. Amount to be subscribed and paid in within one year. Passed 8th April, 1874 Whereas the Parish of Sussex, in the County of King's, offers advantageous situations for the quarrying and working of lime stone, and quarrying and manufacturing of plaster; and for procuring the requisite capital it is desirable to incorporate into a body politic and corporate such persons as may be willing to advance funds for such undertaking:- Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. William Pugsley, Junior, James Christie, M.D., John M. Smith, J. Herbert Crawford, M.P.P., Robert Pugsley, and James W. Nowlan, M.P.P., their associates, successors, and assigns, shall be and they are hereby erected into a body politic and corporate, by the name of ""The Sussex Lime and Plaster Company,"" and by that name shall have a common seal, sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended, in all Courts and places whatsoever, and shall have power, right and authority to purchase, hold and enjoy lands, tenements and heriditaments for them and their successors and assigns, and all other powers and privileges now incident to a Corporation by any Act of Assembly of this Province, for the purpose of quarrying, manufacturing and trading in plaster and limestone, conveying the same to market, opening and working quarries, and other business connected therewith; and also that they the said Company, or a majority of them, shall from time to time and at all times have full power and authority to constitute, ordain, make and establish such bye laws and ordinances as may be deemed necessary for the good rule and government of the said Corporation, provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes of this Province, and those in force within the same. 2. The capital stock of the Company shall be fifty thousand dollars, with liberty to increase the capital stock to one hundred thousand dollars, to be divided into equal shares of twenty dollars each, to be paid in at such times and instalments as the business of the said Company shall require and every person who shall be a holder of one or more shares shall be entitled to vote, either in person or by proxy, having one vote for each share as aforesaid; provided however, that it shall be lawful for the said Company, or a majority of them, to establish by their bye laws as aforesaid, the number of shares which shall be necessary to entitle the holder thereof to more than one vote; and it shall be lawful for said Corporation to grant certification of paid up stock, in whole or part payment for the consideration of lands, quarries, buildings, machinery, mining rights and privileges in the place of money subscription to said stock, at such valuation as a majority of all the

stockholders present or represented at any meeting shall fix. 3. The first meeting of the said Corporation shall be held at Sussex Vale, in King's County aforesaid, and shall be called by William Pugsley, Junior, or in case of his death, neglect, or refusal, by any two of the said Company, by sending a written or printed notice to each member of the said Company, at least ten days previous to such meeting, in order to organize the said Company, and for the purpose of establishing bye laws, choosing Directors and such other officers as may be necessary, which Directors and officers so chosen shall continue in office until the the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present or appearing by proxy, shall organize said Company, establish bye laws, and choose Directors of the said Company, by a majority of votes. 4. Each and every shareholder in the said Corporation shall be and be held liable to the said Company for each and every call or assessment made, not however to exceed in amount the stock subscribed by him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, or for the purpose of carrying on the operations for which the said Company is incorporated; which call or assessment may be sued for by the said Corporation, and recovered in any Court of Record within the Province. 5. The Company or the Directors, if empowered by the bye laws of the Corporation, shall have power from time to time to levy and collect assessments upon the shares, or upon such of them on which the amount subscribed has not been paid up, of such sums of money as may be necessary for carrying on the business, or for the purpose or operations of the said Company; and whenever any assessment shall be made as aforesaid, it shall be the duty of the Treasurer of the said Company to send a written or printed notice thereof to each shareholder, requiring payment of the same within thirty days, and if any stockholder shall refuse or neglect to pay to the Secretary or Treasurer the amount of such assessment upon his share or shares at the time in such notice prescribed, the same may either be sued for and recovered in the prescribed in the last preceeding Section, or the Secretary or Treasurer may advertise all such delinquent shares for sale at public auction, giving at least thirty days' notice in writing to such shareholder, of the time and place of such sale; and all shares on which the assessment or any part thereof is not then paid, with interest from the time such assessment became due, may be sold to the highest bidder; and after retaining the amount of such assessment, and all interest due thereon, and all expense of advertising and selling, the residue (if any) of the moneys paid over to the former owner or owners thereof, and a new certificate or certificates of the shares so sold shall be made out and delivered to the purchaser or purchasers thereof. 6. No shareholder shall be entitled to transfer or vote upon any share after any call shall have been made in respect thereof, until he or she shall have paid all calls for the time being due on every share held by him or them. 7. An annual meeting of the shareholders of the Company shall be held for the transaction of general business and the election of Directors; the time and place of meeting and the number of Directors to be regulated by bye law. 8. The principal office of the Company shall be in Sussex, in the County of King's, but the Company may establish agencies or branch offices in any part of New Brunswick. 9. The transmission of the interest in any shares of the capital stock in consequence of the marriage, death, bankruptcy or insolvency of a shareholder, or by any other lawful means than an ordinary transfer, shall be authenticated and made in such form, by such proof, with such formalities, and generally in such other manner as the Directors shall from time to time require, or by any bye law may direct. 10. The shareholders of the Company shall not as such be held responsible for any act, default or liability whatsoever of the Company, or for any engagement, claim, payment, loss, injury, transaction, matter or thing whatsoever relating to or connected with the Company, beyond the amount of their respective shares in the capital stock thereof. 11. The Directors may from time to time, with the consent of a majority of the shareholders present or represented in a special meeting called for that purpose, borrow money on behalf of the Company; and the Directors may, for that purpose, make or cause to be made bonds, or other instruments, under the common seal of the Company, for sums of not less than one hundred dollars each, which shall be a lien and charge on the stock and property of the said Company; provided that the aggregate of the sum or sums so borrowed shall not at any one time exceed one half of the amount of the paid up capital of the Company for the time being; and no lender shall be bound to enquire into the occasion of any such loan, or into the validity of any resolution authorizing the same, or the purpose for which such loan is wanted. 12. Unless fifty per cent of the

Royal Gazette - Apr. 8, 1840 Cap. XLIV. An Act to Incorporate the Saint George Lime Company.9 Passed 25th March, 1840. Whereas a Joint Stock Company or association hath lately been formed within this Province, which has invested considerable sums of money in the purchase of a valuable tract of Land abounding with Lime Stone at L'Etang, in the County of Charlotte, and made extensive Lime for home consumption and exportation; and whereas it hath been deemed expedient to afford protection and encouragement to the said Association by an Act of Incorporation; 1. Be it therefore enacted by the Lieutenant Governor, Legislative Council and Assembly. That William Savage, Zebedee Cook, Junior, Thomas Dexter, Joshua C. Bates, Joseph Willard, Thomas Darling, Joshua Tucker, Elijah Thayer, David A. Simmons, Josiah Reid, Thomas J. Whittimore, Jonas L. Sibley and De Vere Burr, their associates, successors and assigns, shall be and they are hereby erected into a Company for the purpose mentioned in the Preamble of this Act, and declared to ba a body Politic and Corporate by the name of The Saint George Lime Company, and by that name shall have all the great powers and privileges made incident to a Corporation by Act of Assembly of this Province. II. And be it enacted, That the first meeting of the said Corporation, shall be called by De Vere Burr, or in the case of his death, neglect or refusal, by any two of the said Company, by giving fourteen days notice previous to such meeting, which shall be holden at the time and place specified in such notice. III. And be it enacted, That the Capital Stock of the said Corporation shall consist of the sum of twenty five thousand pounds, to be paid in such money as shall at the time of the several payments herein after expressed be a legal tender in this Province, fifteen per cent. of the said Capital Stock to be paid in before the said

Corporation shall be entitled to purchase any property real or personal, or incur any debts, and the remainder of the said Stock to be paid at such time and times, and in such parts or portions as the Directors for the time being shall from time to time think necessary, the whole amount of such Capital Stock to be divided into one thousand Shares of twenty five pounds each. IV. And be it enacted, That unless fifteen per cent. of the said Capital Stock shall be actually paid in for the purposes of the said Corporation, and a certificate of such payment made and verified on oath by the Directors of the said Corporation, or a majority of them (which oath any Justice is hereby authorized to administer), shall be filed in the office of the Secretary of the Province before the expiration of three years after the passing of this Act the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years."

Royal Gazette - Apr. 18, 1888 Public Notice. Notice of intention to apply for incorporation by Letters Patent under and in terms of the provisions of the New Brunswick Joint Stock Companies' Letters Patent Act, of the Portland Lime Company. 1. The proposed corporate name of the Company is the Portland Lime Company. 2. The object of said Company is the manufacture and sale of Lime, Marble, Lime and other Stone, and the leasing and owning of real estate, vessels or other property in connection with said business. 3. The place of business is the City of Portland, New Brunswick. 4. The amount of Capital Stock of the Company actually subscribed is thirty thousand dollars. 5. The number of shares is three hundred, and one hundred dollars is the amount of each share. 6. The following are the names, addresses and calling of the applicants, the first three named of whom are to be the first or Provisional Directors of the Company:- Darius B. Warner, of the City of Saint John, Mill owner. Ezekiel B. Ketcham, of the City of Portland, Manufacturer. James R. Warner, of the City of Saint John, Mill owner. J. Henry Leonard, of the City of Saint John, Accountant. William C. Purves, of the City of Portland, Manufacturer. James Straton, Solicitor for Promoters."

Royal Gazette - Nov. 12, 1842 We draw attention to the extracts from two Reports of Doctor Gesner on the Tobique and RestigoucheRivers, which he was deputed to explore, with a view to ascertain the capabilities of lands for settlement. To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, I beg leave to lay before Your Excellency a brief report on the explorations of the Tobique River. A more particular account of which will be contained in the report on the settlement lands. The Tobique River is the largest tributary of the St. John, excepting the Restcook, to which it is very nearly equal. Its mouth is twenty miles below the Grand Falls, and two miles below the confluence of the Restook with the main stream. The main Tobique extends to the northeast, and about a hundred miles from its mouth by the courses of the River, it is divided or forked into four branches. One of these branches enters from the southeast, and is supplied with water by three lakes, the largest of which is twelve miles in length. These lakes are situated at the chief sources of the main northwest Miramichi. The Indian portage between the St. John and Miramichi waters is only one mile in length. The other branches of the Tobique extend northward and meet the heads of the Nepisiguit and Upsalquitch, whose waters descend in an opposite direction to the Bay Chaleur. The Tobique, Miramichi, Nepisiguit and Upsalquitch Rivers, all take their rise in one district, and at the bases of the highest mountains in New Brunswick. Extending across the State of Maine in a northeasterly direction, there is a chain of high lands, occasionally elevated into mountains of considerable altitude. This branch is a part of the Allegheny chain, and embraces Cataadan and other mountains in the State of Maine. After entering New Brunswick, this branch sends up Mars Hill, Moose Mountain, and Bear Mountain, on the St. John, between Woodstock and the Grand Falls. The same range extends in a northeast direction to the heads of the before mentioned rivers, where some of the mountains exceed two thousand feet in height. This mountainous district gradually subsides as it approaches the Bay Chaleur, and the north coast of the Province is remarkably level. Another alpine ridge extends through the middle of the District of Gaspe, and separates the waters that flow into the St. Lawrence from those that fall into the Bay of Chaleur, and River St. John. The Tobique, Nepisiguit, and Upsalquitch, all take their rise in the broken and mountainous termination of the New Brunswick range; and after descending from fall to fall, they sweep through the vallies and receive the tributaries of the lower grounds, until they are lost in the larger streams into which they open. As the Tobique River and its tributaries are uninhabited, a sufficient stock of provisions was procured, and three Indians, with as many light bark canoes were hired for the expedition. Accompanied by my son, and Mr. James Millidge, the ascent of the river was commenced. We started from Fredericton on the 27th of June, and reached the mouth of the Tobique with the canoes, instruments and baggage, on the 3d of July. At the entrance to the river there is a considerable tract of intervale, which with several thousand acres of excellent upland belongs to the Melicete Indians. There is here an Indian village containing two hundred souls, and as this place is a depot for Timber, upwards of three hundred men were employed in preparing rafts of Timber to descend the main stream. As these Indians scarcely cultivate their lands, and their grant occupies a most important situation, it would be advantageous if some exchange could be made, whereby they would possess equal if not greater privileges. I am confident that if these valuable lands could be obtained by other inhabitants of the country, they would be immediately settled, and a flourishing town would soon be built upon the grounds now unprofitably occupied by the Aborigines. During the rafting of the Timber, many of the Indians are employed; but their chief occupation is hunting and fishing. We observed among them a quantity of Fur, taken from Ambrose Bear and his brother, valued at œ150, among it were eighty Beaver skins, and about thirty pounds of Castor. About a mile above the Indian Village there is a dangerous rapid called the Narrows. At this place the River to the distance of a mile passes through a gorge only one hundred and fifty feet wide, and between cliffs from fifty to one hundred and fifty in height. It is evident that at some former period there has been a great fall at this place, and their evidences that the barrier to the water has been broken, and the River above gradually lowered. The water rushes through the gorge with great violence, and the projecting masses of rock produce dangerous rapids. During the freshets of Spring and Autumn, this channel is too narrow to give vent to the river; and the water from being thus partially dammed up, overflows the shores above to the distance of two miles. At such periods boats and canoes cannot pass; and such was the violence of the rapids in July, that we were compelled to draw our canoes up with tow-lines. The navigation of the River at this place, might be rendered safe and easy, by the erection of dams and locks; there is here an excellent site for Mills which might be set up, without much injury to the salmon fishery. From the mouth of the river to the Red Rapids, a distance of twelve miles, there is some good intervale, the lands are high and the soil productive. Several squatters have settled on the banks of the stream. The Tobique Mill Company built a dam across the river, and erected extensive saw mills in 1837, but before these mills were put in operation, a part of the dam was carried away. The Mills have since been taken down with the intention of moving them to the Narrows below. œ27,000 were expended by the company at this place. Three millions of logs that had been cut, have also been lost in the speculation. The establishment is now a deserted village. If a dam should be built across this stream, a free passage for salmon and other kinds of fish should be secured, as there is scarcely a better river fishery in the Province. Our third encampment was at Plaster Island about twenty five miles from the St. John, and two miles above the mouth of the stream called by the lumbermen Wapske or Wapskehegan. Between the island and the Red Rapids, the Otelloch, Otella, three brooks, and other smaller rivulets enter the Tobique. The main River here is extremely beautiful, being decorated by numerous small islands and belts of intervale, covered with elms, balsamic poplars, and other trees characteristic of a most fertile soil. The Wapskehegan is a large stream coming in from the eastward. At its sources it approaches very nearly a branch of the Miramichi, and it runs through a fine tract of intervale and excellent upland. A mile below the Red Rapids, the calcareous shales of the St. John are overlaid by a bright red sandstone, a rock that always indicates a good soil. This sandstone occupies a large tract in this quarter, and extends up the River to the base of Blue Mountain, twenty miles farther northward. At Plaster Island, on the banks of theWapskehegan, and so far as we could discover in a district of several thousand acres, there is an abundance of excellent gypsum. At the Island on the left bank of the Tobique, the gypsum occurs interstratified with the red sandstone in a cliff 135 feet high. It is of the fibrous and compact varieties, and some of the strata are of a bright red color. This gypsum may be transported from the Wapskehegan down a branch of the southwest Miramichi, and supply the country in that quarter, as well as the valley of the St. John, with excellent mineral manure. A short distance above the head of the island,there is a small brook of brackish water, it proceedsfrom a salt spring, a mile and a half from the river. There are also other indications of rock salt in this quarter.About a mile farther up the stream I discovered an immense ridge of limestone, at the side of the River. This limestone is stalactital like that found in the interior of caves. Apparently the river at this place, has broken into a cave of considerable magnitude, and stalactites are scattered along the shore. From the deep fissures and chasms concealed beneath the fallen trees and other vegetable rubbish, it is dangerous to walk over this rock; there are many good reasons for believing that the earth is cavernous at this place. Above Plaster Island the river becomes very serpentine, and where the intervale is absent, the banks on each side are from fifty to a hundred feet high. About twelve miles above the mouth of the Wapskehegan, another large stream called the Agulquac, enters from the eastward; this stream also passes through a fine tract of country. A large area here was overrun with fire a few years ago. It is probable that this was the same conflagration that destroyed the towns and villages of Miramichi, in October, 1825, but as there are no inhabitants in this quarter, the exact period of its occurrence has not been ascertained. From the mouth of the Agulquac to the base of Blue Mountain, is about eleven miles, the River here is eighty yards wide, and is skirted with fine tracts of intervale. There are also numerous alluvial islands covered with lofty and thick foliage. At the foot of the Mountain the red sandstone reposes on the transition slates. The whole country from this mountain is comparatively level; but from this point northward, it assumes new features and becomes more elevated. About eighty miles from the mouth of the Tobique, the river divides into four branches. The Little Tobique, Mamozekee, and Right Hand Branch, extend to the source of the Nepisiguit, and wind their way among naked and almost inaccessible mountains of granite and trap rock. Bald Mountain is 2,240 feet high, and is surrounded by several lofty peaks, but little inferior in altitude. It was my intention to have visited all these mountains, but the streams had become too dry for our canoes, one of our Indians had deserted, and the two that remained, refused to proceed any further into the wilderness. Our provisions were reduced almost to the choice of fish caught in the stream, and our faces and limbs were swollen and painful from the innocent stings of the insects in the forest. The whole surface of the country in the direction of the Tobique River, from its mouth to the distance of eighty miles northward, is capable of the highest degree of cultivation. The soil in general is equal to, and often surpasses the best kinds I have seen in the Provinces. I had supposed, from the accounts received from persons who had been engaged in procuring timber up the stream, that there were many places where the soil was unfit for cultivation; but such an opinion has arisen from the dreary appearance of the surface, where it has been overrun with fires. In every quarter we found a deep, rich, and strong soil. Formerly there were immense groves of white and red pine in the vicinity of this stream, but most of these have been removed or destroyed by fires. At present there is comparatively but a small quantity of pine, spruce, cedar and sometimes beech, birch and maple. Along the whole course of the stream, there are tracts of the best quality of intervale, covered with elm and balsamic poplar, ash, alder, &c. Wild hay is abundant. Besides these, we found indigenous grape, wild plums, currents, gooseberries, mint, rhubarb, and onions, with all those plants which only flourish on the richest soils. In descending the river, I counted seventy islands, all composed of alluviums. The limestone, gypsum, and salt, are very valuable in this part of the Province, and they are so situated that they may be transported over a wide extent of Country at a trifling expense. The river abounds in salmon during the season, and there is always an abundant supply of trout and whitefish in its waters. John Cahile, who lives near the mouth of the river, killed twelve barrels of salmon with a single spear last season; they were sold for œ5 per barrel. The river is navigable for canoes and tow-boats about one hundred miles from its mouth. There is only a portage of two miles between its head waters, and the Nepisiguit, and one of three miles to the Upsalquitch. The lands upon the Tobique remain ungranted. Under a due consideration of all the advantages offered by the river and for the soil of the intervales and uplands, I am fully of the opinion that this tract of country, which embraces several millions of acres, is better adapted to the circumstances of respectable Emigrants and other settlers, than any other district I have seen in New Brunswick or Nova Scotia. Much confusion has arisen in the names of places within the Province from the careless manner in which these names have been written and spoken. A great number of rivers and lakes still retain in some degree, the ancient names of the Melicete and Micmac Indians; but those names in many instances have been changed or corrupted ao that they are not now understood by the Aborigine themselves; and they are seldom written in the same manner by the inhabitants of the Province. Other names are those of the early French settlers; these also have become imperfect, and even English names are sometimes written improperly on Maps or other public documents. I have taken the liberty to insert the names of places on the Tobique, as used by the inhabitants, and opposite to them the Indian names. Tobique Naa-cootke, Otelloch Hotelle, Otella Na-me-taaps-k-waac-sis, Mamozekel Epe-ce-tus-sis, Right Hand Branch Qua-quaps, Serpentine River Wa-ca-souis, Lake Quispaam, Trowsers Lake Nee-taa-waac-paac, Sisson Branch Wa-caa-so-nee, Little Tobique

Carleton Sentinel - Jun. 4, 1850 Report on the Agriculture Capabilities of New Brunswick (#4) by J.F.W. Johnston, F.R.S., &c. In the Geological Map, No. 1, attached to the Report, it will be seen that, a large breadth of the province rests on what are called the Coal Measures.These strata or beds of rock are of the same general age as those in which the productive coal beds of Nova Scotia, of Prince Edward Island, of England, and of the United States occur, and they contain in various places the seams of coal which are to be seen in many parts of the Province. Attempts have been made, from time to time to work these beds, especially on the Grand Lake, the Memramcook, the Petitcodiac, the Salmon River, the Coal Creek, of the Saint Nicholas River, and in other localities; all these attempts however, owing in part to the thinness of the seams, to the impurity of the coal, and to their occasional high inclination, have failed to raise the mineral in any considerable quantity, or to yield a reasonable profit to the undertakers. The existence of available beds of coal in the Province, has hitherto been looked upon more in an exclusively manufacturing and mercantile, than in an agricultural light. Iron ore is said to be abundant, and if coal could be found to smelt it, centres of industry would spring up which would enhance the price of agricultural produce in their neighborhood. This is true, but the actual existence of the coal would render unnecessary the large growth of wood for fuel, and would thus set free a great extent of land for the exercise of rural industry and the growth of corn. On the other hand, if this iron is to be smelted with wood, the extent of the manufacture, however desirable in other respects, would greatly increase the demand for fuel, or of land to be kept in perpetual forest, and would in like proportion lessen the agricultural resources of the Province. The existence and possibility of profitably working beds of coal in New Brunswick, is as important therefore to the agricultural as it is to the other interests - to the development of the agricultural resources of the different parts of the Province, and to the formation of anything like a correct estimate of the extent of these resources. In reading over Dr. Gesner's reports in regard to the Geology of the Province, I have been struck with the labour he has felt himself obliged to expend year after year in exalting the dignity of geological science, its money value in discovering natural resources of a country, and its consequent claims upon general consideration and support; like all men whose fate is to pioneer the way to new views, new studies, and new habits of thought, he evidently writes as if he felt his work to be very much up-hill - as if he were labouring for men who did not generally understand or appreciate his task, and he was therefore induced occasionally to minister a little too strongly to the vulgar views of immediate profit from scientific enquiry, and thus to create expectations which his own labours did not realize. This was especially the case in regard to the richness of the coal fields of New Brunswick. From all I have seen or learned, the opinions he expressed and the hopes he awakened on this subject were much too sanguine and in a considerable degree exaggerated. This proved unfortunate in many ways; it has not only injured his own reputation for general accuracy, and diminished the confidence with which his Reports generally were read, but it lessened the confidence of the people in the predictions of the science generally, and probably prevented or retarded other researches which might have been undertaken in reference to the Geology and Mineralogy of the Province. With a view to placing before Your Excellency at a glance, a summary of all that is yet known of the coal deposits in New Brunswick, I have requested my friend Dr. Robb to fill up the following table, (No.1). The materials are derived chiefly from Dr. Gesner's reports, but the principal observations of Dr. Robb and myself are also included. From this table and the report annexed to it, it appears that nearly all the seams that have been discovered are very thin, that such as are thicker are represented to be poor in quality, and that very little coal has yet been extracted or is likely to be profitably obtained from them. Many of those varieties called cannel and gascoal appear to be only bituminous shales which leave an ash nearly as bulky as the original coal. The gas coal ofthe Memramcook River is of this kind, and its quality for the manufacture of gas may be judged of from the fact that a ton of it yields only a thousand pounds of gas, as tried in the Saint John gas works, while the best qualities of English and Scotch cannel, and of Behimmon's coal from the County of Durham in England, yield 12,000 cubic feet. The discovery said to have been made of a thickbed of bitumen on

Frederick's Brook, in Albert County, is very interesting, and should reports not be exaggerated, will undoubtedly prove a source of profit. Fredericton, 26th Nov. 1849 Sir. - In compliance with your request that I should prepare a ""short notice of the existence of coal in New Brunswick, and its consequences in the Colony as derived from my own observations and enquiries, and the published reports of Dr. Gesner,"" I have drawn up the following Report:- More than one third of the area of New Brunswick is occupied by rocks whose composition and contents, both 3 mineral and fossil resemble those peculiar to that which as a whole has been termed the Carboniferous system of rocks. A great portion of the space occupied by them, say seven or eight thousand square miles, has been termed by Dr. Gesner the ""Great New Brunswick Coal Field."" Its area is very considerable, although it is not ""one of the largest ever discovered upon the globe."" (Rep. IV. p.64) The Illinois coal field, says Sir C. Lyell, is about as large as the whole of England, (Travels in N.A., I.28;) and the area of the Appalachian coal field, according to Prof. H. Rogers, ""upon a moderate estimate amounts to sixty three thousand square miles."" (Trans. Assoc. Am. Geology, I. 436). The carboniferous rocks of New Brunswick form but part of that series, which as a whole has been termed by Mr. Logan and others the Eastern coal field of North America. The rocks of this series first appear on the northern margin of the Bay de Chaleur, (and probably at one period occupied the whole of it,) thence pass deeply into the interior of New Brunswick and Nova Scotia, and constitute no inconsiderable portion of the Islands of Prince Edward, Cape Breton and Newfoundland. The rocks or measures which constitute this system are conglomerates, sandstones and shales of various degrees of fineness and purity, and of various colours, but all obviously deposits from water. Subordinate to these we have beds of limestone, coal and plaster, and occasionally ores of iron, copper and manganese. In many other countries there is a very exact line of demarcation recognized between the rocks of the coal series and those above and below it, but in this country there is still considerable difficulty in defining the limits of these respectively; and although I consider most of the sandstones, conglomerates and shales of New Brunswick to belong to the carboniferous system of rocks, this term must for the present be construed so as to include the true coal measures and others below them as far as the old red sandstone or Devonian series, as understood by Sir C. Lyell and other Geologists. By the observations of Lyell, Brown and Dawson, in Nova Scotia and Cape Breton it would appear that the carboniferous system of the eastern portion of North America may be divided into three groups or formations, each of which is no less than six thousand feet in thickness, - these are - 1st, an upper, consisting chiefly of reddish measures, with two thin beds of coal and one of gypsum, a middle, which consists of gray and brown sandstone with workable beds of coal and ironstone; 3rd. a lower consisting chiefly of reddish sandstones and conglomerate with a few thin seams of coal, and with much plaster and limestone. In Dr. Gesner's reports on the Geology of this Province, red rocks, or rocks accompanied with plaster, have generally been termed new red sandstone, and have been said to overlie the coal measures; but if the red rocks which contain the plaster, really underlie the productive coal measures of New Brunswick as in Nova Scotia and Cape Breton, and as I suspect they do, a revision of the matter will be required; at present there is much difficulty in making use of this data regarding the order of superposition in this part of our series of rocks. Speaking of the consequences of Coal in this Colony, Dr. Gesner says (Rep. IV, 18) - ""The immense but unexplored deposits of coal in the Province are sufficient to supply Canada and all the demands of the existing coasts of the Gulf; they are capable of sustaining manufactories, railroads and steam communication to an extent scarcely to be contemplated in the present day, and they will also support a trade with other parts of the world."" Further he adds (IV. 64) that ""when it is considered that one third part of this country contains more or less of the bituminous mineral, the quantity of coal in New Brunswick will appear inexhaustible;"" - and in another report to the Legislature, when speaking of the same subject, he says, ""when all the circumstances are duly considered, it may be seen of what importance New Brunswick is destined to become, not only to herself and her sister Colonies, but to great Britain and the United States, whose supplies of Coal must, to a great extent, be dependent on these colonial resources."" (III. 36). In order to afford more definite ideas concerning the beds of coal actually known to exist in the Province, and to enable us to estimate at its real value the ground work of the many vague assertions which from time to time have been made concerning this department of our mineral resources, I propose to bring together short notices of all the known outcroppings of coal in the different counties of the Province.York.-1. An outcropping of coal, resting on fire clay, may be seen at a side cut on the right bank of the River Nashwaak, nearly opposite Mr. McLean's farm; the coal does not seem to be more than a few inches in thickness, and could not be worked with any profit there. 2. On the Tay Creek, a branch of the Nashwaak, coal has long been known to exist. In walking up the stream, from its mouth, drift pieces are found occasionally, and then become larger and more abundant till we reach a bend in the river, under a high bank of gray sandstone, above which no more coal is observed; hence it is supposed that the outcrop is near, and as it is not in the cliffs it must be in the bed of the brook, where, however, I did not detect it. Some of the pieces found near this place were about ten inches thick, though it is possible that 5 the proper seam may have been thicker. The dip of the sandstones was easterly, and very low, so that the coal may have been connected with the seam seen on the Nashwaak. 3. I have a specimen of coal from land near McLeod's Hill, on the Royal Road; but I am informed, on good authority, that the seam from which it came is thinner than either of the above. 4. Dr. Gesner (IV. 26) considers ""it is far from being improbable that coal might be procured at the very capital of the Province, although the rocks themselves offer but few indications of its existence near the surface."" As the rocks near Fredericton have an easterly dip, and as there are no appearances of coal in the sandstones, which run out a short distance to the westward, we are hardly warranted, as yet, in supposing that coal will ever be mined at this locality. 5. I have long understood that coal has been got on Lyon's Creek, a small tributary to the Oromocto River, and that it had been used by a blacksmith near Hartt's Mills; on making further enquiry, however, I found that it was only a few inches in thickness, and therefore unavailable. I presume that this is the bed alluded to by Dr. Gesner, (I. 71) of which he says, ""the coal is only four inches thick, and appears on the bank of the river between strata of bituminous shale, where fossil remains are abundant; that there are thick beds of coal beneath, however,"" he adds ""there can be no doubt."" Enough is said to excite the imagination, but not to satisfy the reason. Sunbury. -Exploratory surveys and boring for coal were undertaken some years ago in the Parish of Burton, but in no case, I believe, was workable coal discovered. Queen's. -1. I have understood that some borings were made near Gagetown, but they were unsuccessful. Dr. Gesner (I. 73) observes that ""no doubt can be entertained that Coal may be procured in the County adjacent to Fredericton and Gagetown."" This remains still to be seen. 2. Coal has been got on the Grand Lake for upwards of forty years, but as yet there are no workings of any extent in any part of its valley. The coal occurs near the head of the Lake, and at present it is chiefly worked on the Shore Road, south of the Newcastle Creek; the workings are either open to the day, or adits run in from the side of the hill, on the rise of the measures, which dip towards the lake at an angle less than 10ø. At one of the levels the section observed by me was as follows:- Clay drift of surface 8ft. 0in. Shaly sandstone 1 6 White clay 0 8 Fire clay 4 0 Coal with pyrites 0 4 6 Black clay (sheepskin) 0 1 1/2 Coal (main seam) 1 3 Underclay (pavement rock) unknown --------- 15 10 1/2 At another place, where the measures were seen at a ""stripping,"" or open digging, the appearances were as follows:- Red clay 1 ft. 1 in. Soft yellow clay 3 6 Hard yellow clay (coal rock) 3 0 Blue shale 1 6 Coal 0 4 Black clay 0 2 Coal 1 6 Underclay unknown --------11 0 As may be supposed, the mining operations are all carried on in a small and rude manner, yet, from time to time, I believe that nearly 2000 chaldrons per annum have been brought to market. Within twenty years all the coal was got by strippings, or open diggings, but since that it is chiefly got out by adits and levels; of these there are a great many on the Newcastle Creek, on Salmon River and on Coal Creek. The settlers of the vicinity used to go into these mines during the winter instead of going into the woods. Messrs. Berton Brothers of Saint John, have recently taken out mining leases and wrought the coal on a somewhat more extensive scale. The coal is bituminous, and cakes or fuses when heated, so as to form a hollow fire admirably fitted for blacksmith's use, but less for ordinary grates, without frequent stirring. The Grand Lake coal now brought to market is much better cleaned from pyrites (""sulphur"") and clay than it used to be formerly, and I believe that it is preferred by the Saint John blacksmiths to any of the imported varieties. The uniform quality, thickness and depth of the coal got at the Lake district, lead to the conclusion that one bed only has been opened as yet. Dr. Gesner says, however, (III.72) ""there can be no doubt that there are other and far richer deposits of coal beneath the one already discovered, but at what distance from the surface it is impossible to calculate, in consequence of the almost horizontal position of each stratum in the coal series."" If the outcrops of other and far richer deposits of coal had been known - if they had dipped towards the quarter alluded to - and if they had not suffered much denudation, the above expression would have been more justifiable than they appear. An exploratory boring was undertaken in 1837, by the Salmon River Coal Company, at a cost of œ2000, but 7 the returns (supposing them to be correct) gave but little promise of upwards of 400 feet, and in this Distance a few thin seams of coal were passed through, and one of bituminous shale and coal, 8 feet thick was reported; nothing further was done, and the company broke up. 3. Coal has been found on the Washademoak River near the mouth of Long's Creek - its thickness is about a foot, and according to Dr. Gesner (III. 60) ""is probably accompanied by more valuable deposits than have yet been discovered."" 4. Coal has also been reported as occurring on the New Canaan River, another branch of the Washademoak, but it is not unlikely that both this and the former may be part of the same bed as that seen at the Grand Lake. King's. -1. In Dr. Gesner's second report (p.63) it is mentionedthat the rocks of the Westmorland coal field occur at Ward's Creek, a small stream which flows from the south and joins the Salmon River at Sussex Vale. At the farm then held by Mr. A. Sheck he reports ""a stratum of impure cannel coal, about three feet in thickness, and from the qualities of this kind of coal mingled with the debris of the surface, it is evident that it exists in much greater quantities and a quality more pure in situations now concealed by beds of sand and other detrital matter."" This stratum, accompanied by a fine grained sandstone, containing remains and impressions of plants of the coal period, was observed towards Dutch Valley, and, as Dr. Gesner adds, ""although the largest and most important beds of coal remain undiscovered, yet an advancement is made towards their development."" (p. 64) In 1847 I had an opportunity of visiting the farm mentioned above, and then I found a brownish bituminous shale or slate in contact with a sandstone containing remains of what appeared to be fucoids. We made a wood fire, and got the former to burn; still there was too much earthy matter present to entitle it to be included under the head of coal. Albert. -1. In the Pollett River about fifteen miles from where it joins the Petitcodiac river, small seams of coal appear in its bed, and some drift coal is found in theneighborhood. Dr. Gesner (II.65) observes in regard to this case ""that it is abundant in the concealed strata beneath, appears very evident."" Coal may or may not be abundant underneath, although it is hardly fair to require us to admit that it is very evident that it is either one or the other. 2. In the following pages of the same Report, coal is stated to appear at the head of Turtle Creek, and ten miles N.N.W., from Shepody; it was likewise seen on Mr. Stephens' land where a stratum of coal ten feet in thickness was observed in the bed of a brook; the coal 8found in this vicinity is said to be of a much superior quality to any along the whole line of outcropping, it kindled quickly, and afforded a greater quantity of carburated hydrogen gas than any of the imported varieties. The earthy matter varied in quantity from twelve to twenty-five per cent, and the ashes contained carbonite of lime. The outcrop of this coal was within five hundred yards of trap and syenite, which form a steep and high declevity along its southern edge to the distance of ten miles. Although the proportion of ashes above stated is very large, the above mentioned stratum must be regarded as one of considerable importance, and I regret that I had not an opportunity of seeing it with you when we were in Albert county together. It ought to be tried experimentally at the Saint John gas works or elsewhere. 3. Dr. G. (III. 28) mentions the occurrence of a bed of coal at Frederick's Brook, a branch of Weldon's Creek, which flows into the Petitcodiac river, in the Parish of Hillsboro'. It exists, he says, ""in several separate strata, the largest of which is about nine feet in thickness."" The quality of this coal is stated to be superior to that of the Memramcook or Stephen's farm, mentioned above; a quantity of it was collected and fired in the bed of the stream, it ignited readily and burned with great splendour; the strata consisted of sandstone, slate, bituminous shale and coal which ran E. and W. with a southerly dip. I visited this place in October last, and found on Mr. Steeve's land, near the bend of Frederick's Brook, a good deal of brownish bituminous shale, but no coal whatever. Subsequent to the period of Dr. Gesner's Report, a boring had been made for coal by Messrs. Bryant and Sherer; we saw some of their old works near the edge of the brook where they had bored to a depth of 40 feet, but without finding any coal. Mr. Steeves showed me what had been regarded as coal, but it proved to be Mineral Pitch or hard bitumen; it had only been found, he said, in small rolled fragments in the surface drift of his fields. The occurrence of this mineral in New Brunswick is interesting, but it was impossible for me in a hurried visit to attempt to discover its proper site. 4. Coal occurs on Mr. Richardson's land, at Cape Enrage, in Chignecto Bay; you yourself visited it in October last, and informed me that it was of the common kind, about eight inches thick, and occurring with the usual shales and sandstones, which dip at a very high angle; that the coal section was very good, and that if other beds had existed, besides the above, they would have been readily seen. (II.23) 5. At Salmon River, further west, and on land belonging to Mr. Foster, coal was spoken of also, but it was said to be impure and of small extent. 6. On the south side of Grindstone Island, Dr. G. reports 9 ""several seams of soft red shale with narrow seams of coal."" The course of the strata is W., and the dip S 40ø; although there are indications of coal at several localities, no out-cropping of any practical value was discovered on the shore. (-- 25.) Westmorland. -1. On Taylor's farm on the west side of the MemramcookRiver, four miles above Dorchester, there is a good natural section of the coal measures; the dip is S.S.E. and nearly 40ø. Here occurs a bed of highly bituminous shale 4 1/2 feet thick, into which an adit has has been made by Mr. Steadman; it ran in, on the dip, for forty or fifty feet, and if followed much farther in the same direction would issue below high water mark; about 200 tons of the mineral were piled on the bank for shipment. It is easily set fire to and blazes

Codes: M6 / X1 / LEGI / IDX_Names: York County Coal; Grand Lake Coal; Legislation, etc.;

S.J. Daily News - Apr. 6?, 1876 The Mining Committee's Report. - Mr. Butler, from the Committee appointed on the 18th day of February last, to whom was referred all matters connected with the mining interests of this Province, submitted their report, which was read as followeth: Committee Room, 4th April, 1876. The Committee to whom was referred all matters relating to the mining interests of this Province, beg leave to report - That from a very lengthy and valuable paper prepared by Dr. Bailey of the University, and submitted to them, it appears that the Provincial diamond drill, having failed to reach any considerable depth at Clones, in Queen's County, was located at Three Tree Creek, in the County of Sunbury, in April last, and commenced operations on the fourteenth of that month, and continued to operate there until the early part of November last. A depth of 616 feet was reached, being the greatest depth yet obtained by drill; and while your committee regret that no coal or other mineral was found, it is satisfactory to be able to state that the search was exhaustive, and sets at rest the question of the existence of coal at that point. Dr. Bailey very kindly came before the Committee and gave them the benefit of his knowledge in reference to the Geological indications in that part of the country. He expresses the opinion that any other borings in that section of the country should be made in an easterly direction, and that two holes bored at about equal distances between Three Tree Creek and Gagetown, would set at rest the question of the existence of coal in that region. Your Committee believe that the work performed by the diamond drill during the last season, was, under all circumstances, more satisfactory than in any previous year. It is still at Three Tree Creek, but has not been operated since November. The Hon. Francis Hibbard and Mr. John Steadman appeared before your Committee, and expressed their wish that the Mining Regulations should be so amended as to exempt gold and silver from Royalty for ten years from the date of the License; and that the five per cent Royalty upon these and other minerals, when paid, should be upon the profits of the mine instead of upon the value of the minerals raised. Mr. F. Woods also came before your Committee and urged the desirability of making another trial with the Diamond Drill in the vicinity of Victoria Settlement, Queen's County, and expressed the opinion that the boring in the neighboring locality of Clones' was by no means conclusive. Mr. John Phillips also appeared before your Committee and stated that coal had been frequently found on the Restigouche River, between Dalhousie and Campbellton, and expressed the opinion that the drill should be sent there. Your Committee, in conclusion, must express their regret, that in consequence of the want of success hitherto in the discovery of mines and minerals, their report is necessarily meagre and unimportant. Respectfully submitted, Walter S. Butler, John S. Covert, James McKay, James Ryan, John A. Humphrey."

Kings County Record - Sep. 13, 1945 Geologists Make Surveys In Kings County In 1944. - From the annual report of the department of Lands and Mines of the province of New Brunswick, the report given by Dr. W.J. Wright, provincial geologist, shows that during last year considerable survey work was carried on in Kings County. One party of men under the direction of J.McNeil, made surveys of the salt-bearing areas at Mannhurst, Cornhill and Plumwesweep. Exploration for coal deposits was carried on atDunsinane, where five holes were drilled at intervals within an area of about one square mile, to depths of 181 to 432 feet. Four holes cut coal. There are two groups of seams separated by 10 to 12 feet of shale. The top group varies in thickness from 20 to 32 inches and the bottom seam 24 to 41 inches. Owing to the poor recovery of the coal core it is difficult to determine the actual character of the groups but the conclusion is that they comprise at least two seams of coal separated by shale. The outcrop of one seam in the 'Smith Pit' shows the following in descending order:- Coal, 7.5', shale 6', coal 8'. It is not known whether this is the top or bottom group. The salt bearing areas of the Cornhill-Mannhurst basins were surveyed and plans are being completed to show the property lines, general geology and locations of salt seepages, drill holes. etc. Samples of brine were collected from Mannhurst, Cornhill, Penobsquis and Plumwesweep.

They were analyzed qualitatively in the provincial laboratory by E. Rowley. All samples contain sodium, calcium, and magnesium, and those from Mannhurst, Penobsquis, and Plumwesweep contain potassium. Quantitative analysis was not undertaken because the samples were diluted by varying amounts of rain water."

Royal Gazette - Mar. 14, 1848 Cap. V An Act relating to Salt Mines in this Province. Passed 8th March, 1849 Whereas it is supposed that an extensive and valuable deposit of Rock Salt exists within this Province, and it is deemed advisable that some inducement should be offered for the discovery of the same. Be it therefore enacted by the Lieutenant Governor, Legislative Council and Assembly, That from and after the passing of this Act, it shall and may be lawful for His Excellency the Lieutenant Governor or Administrator of the Government for the time being, by and with the advice and consent of the Executive Council, to grant such remuneration as may be consistent with the public interests, to any person who shall first discover and make known to the Government the situation of any deposit of Rock Salt within this Province; provided always that such remuneration shall be confined to a proposition of the Revenue derived from the sale and

N.B. Courier - Sep. 23, 1837 LETTER II. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May it please your excellency; Having in a former letter, and as briefly as possible, endeavored to give an account of the rocks of the Coal Measures on the west side of Chignecto Bay, and to notice some of their most important characters, I now proceed to the examination of the deposits in the direction of the main road leading from Cumberland to Saint John. There is an inconsiderable ridge of grey sandstone extending from Fort Cumberland in a northeast direction. Along the lower grounds at the base of this eminence it was proposed to open a canal, to communicate with the Bay De Verte; and certainly the situation is most favorable for that object, for advantage may perhaps be derived from a considerable lake, and as the country is low and level, there would be but few difficulties to encounter. Leaving the boundary line between Nova Scotia and New Brunswick southward, the road passes four miles over the great Tantamarre Marsh, one of the greatest collections of marine alluvium in North America. This alluvial deposit extends from several small lakes,situated some distance in the interior of the country, to the head of Cumberland Basin. It is fourteen miles long, and averages about four miles in breadth. Through it the Tantamarre winds its way to the sea, sweeping forward both on the ebb and flood tide the talus which can no longer find a resting place on the banks of a river brought to its narrowest limits by the constant accumulation thus conveyed. Already surcharged with disintegrated sandstone, the river in times of freshet, sends back to the sea the surplus sediment which is fast accumulating at its mouth, and will in time convert Cumberland Basin itself into an extensive marsh. Had the coasts of Chignecto Bay been formed of granite or any other crystalline rock, the present site of the great marsh of Sackville would have remained unobstructed, and now cease to extend its boundaries; but the yielding sandstone giving away before the action of the elements, has not only furnished the materials of the deposit already made, but continues its steady supplies for situations still remaining open, and ready to devour each particle of siliceous and argillaceous matter as it is carried along by the influx of the sea. Large rafts of timber have been buried in these marshes, trunks and branches of trees were often observed projecting from the bank at the bottom of the river - they have been discovered twenty feet below the surface - even the bones of wild animals have met this kind or interment, and large masses of rock having been transported by the ice, have fallen into the same common grave. All these, and perchance the works of art that may have been lodged in this wide receptacle, may a thousand years hence afford matter for grave speculation to those who will not consider the changes constantly going forward upon the earth. Great numbers of white wild geese formerly frequented these places, but they have long since disappeared, and but few of the grey variety now make them a resting place in the Spring. The alluvial deposits in this part of the country are extremely valuable. The inhabitants throw up dykes and embankments against the sea, and thus convert the soil formerly submersed by every high tide, into rich meadows; notwithstanding large tracts are in a sunken and neglected condition for the want of proper draining. The tide in Cumberland Basin rises about sixty feet at spring tides, therefore it is practicable to drain even the lowest lots, and the tide can be shut out by proper floodgates. The soil in the Parish of Sackville rests generally on new red sandstone. This rock reposes on the sandstone of the coal measures, and affords plentiful supplies to its numerous inhabitants. Westcok, the residence of Judge Botsford, has the appearance of an English manor. It overlooks the great marsh, and head of Cumberland Basin, and the beautiful villages scattered along the banks of its rivers. From the beds of clay interspersed near the surface, the country is well watered. There are also collections of sand and gravel. - The farms are small, and not remarkable for neatness, notwithstanding when viewed at a distance, and with the gentle eminences over which they are spread, they form a most pleasing landscape, and the small clusters of trees still remaining - affording shelter and shade to cattle and sheep - are instances of considerable foresight and taste. From Sackville to Dorchester, a distance of nine miles, the road passes over more elevated land; the grey sandstone of the coal measures often containing the impressions of leaves, and other vegetable remains, is predominant; and breaking out beneath the Court House of the latter village, forms a considerable declivity. At some places the rock is covered with a soft conglomerate and red sand, which afford a less fertile soil than the red marly rock of the lower lands. Dorchester and its river were formerly called Memramcook. The principal village stands on a slope, where several grist and saw mills are propelled by the brook descending towards the river. Looking southward, Shepody Mountains appear lifting their tops far above the rocks of the

carboniferous order. Judging from their appearance at a distance they are composed of primary and transition formations; and probably like the Cobequid chain in Nova Scotia, (of which they may be said to form a part), they are the southern boundary of the vast coal district of the Province. The Memramcook river extends in a north direction until its ultimate branches meet those of the Shediac on the Straits of Northumberland. The marsh along its banks is twelve miles long, and embraces four thousand acres. The alluvium here is like that of the Tantamarre, having been derived from the same sources, and collected by the same causes. The upland farm lots all join the marsh, and are well cultivated, forming a broad band down each side of the river. From many points the view is delightful, and characteristic of the Acadian inhabitants, who still retain the French language, habits and costume. Four miles northward of the Court House, there is a bed of limestone interstratified with the sandstone. It would be an excellent auxilliary as a manure, were it applied, and is admirably adapted to the soil of the country, where it has been deposited. Having carefully examined the alluvium of the marshes already mentioned, they were found to contain a much greater quantity of silicious, and less argillaceous matter than those of Hants and King's Counties, in Nova Scotia. These circumstances are readily explained, when it is considered that the marshes of Westmorland are composed of pulverised grey sandstone, while those of the most fertile of the other province consist of disintegrated new red sandstone, which from its containing a greater quantity of marl produces more luxuriant crops. The deficiency of calcareous matter in the extensive marshes of Tantamarre and Memramcook, might however be readily supplied by the application of lime. There are numerous blocks of granite scattered on the surface of this country; from whence they came it is difficult to determine, when so little is known of the geology of the Province. It is most probable nevertheless that they have been exiled from the primary rocks forming the Shepody Mountains, by the force of water which has evidently submerged the country at some remote period in the earth's history. From the bridge over the Memramcook to the Petitcodiac, a distance of ten miles, the sandstones of the coal measures rise to the surface. Here, as in many other situations, the frost, rain, and vicissitudes of the weather, have produced a dilapidation of their strata, and a light sandy soil is mixed with the detritus formed under the more active operations of causes which have long since subsided. The soil thus formed, principally of silicious matter, is by no means productive, and instead of the sugar maple, beech, and yellow birch, the meagre white maple and spruce have here fixed their residence. A number of French families reside on the road, and as is usual with them their farms are small, and their dwellings humble. Arriving at the Petitcodiac river from the eastward, a tolerable high ridge of land will be seen to the northward, and a chain of mountains extending from Shepody appear stretching away to the southward and westward; detached boulders of granite increase in number on approaching this large stream, and collections of fine yellow sand; and beds of clay, may be seen by the road side. This beautiful river, following a serpentine course in a north east direction, turns at almost a right angle at a place called the 'Bend of Petitcodiac', from thence it extends southwest until its branches meet the forked extremities of the Kennebecasis. At the angle thus formed, there is a considerable village, with an excellent landing place for timber, deals, and other productions of the fertile and well populated country in the neighborhood. At high water the scenery is very pleasing, and bears a resemblance to some of the splendid views on the Thames and Mersey, in England; but at low water its imposing effect is lost, and the empty chasm, with its muddy banks, have a disagreeable and gloomy aspect. In this river the tide runs with great rapidity, often opening new channels and sweeping away large collections of sand, and undermining the alluvium produced by its singular powers. So great is the distance over which it must pass in the space of a few hours, that its increasing volume on the flood, particularly at Spring tides, is greater than its speed over the gently inclined 'flats', hence it rolls forward in a foaming tidal wave, sometimes six feet high, sweeping the river with a rush of water like that of a coming deluge. - The effects of such powerful causes appear obvious, in the estuaries of Shepody Bay and Cumberland Basin, where the increasing collection of sand and shingle are undergoing pulverisation to fill more quiet situations with the sinking sediment. Large trees, pieces of timber, and quantities of vegetable matter, drifted from the marshes above, lie buried in these moving sands; wrecked vessels and boats also add to the materials covered in these fearful wastes, over which at high water the largest ships may pass in safety. I have not had the opportunity of measuring accurately the height of the tides in the Petitcodiac, but am of the opinion its highest limits will exceed seventy five feet. Large quantities of marsh on the river have been rescued by dyking, and now yield a plentiful supply of fodder for cattle. The new red sandstone at Sackville, extends in a southwest direction to the ""Bend"", where it is occupied by a number of farms, sloping down the higher grounds on the borders of the marshes to which they are attached. From the Bend of Petitcodiac to Nixon's Inn, a distance of 12 miles, the road extends along the north side of the river. The soil became sandy and light; instead of birch, beech and maple; larch, white and yellow pine inhabit the surface. I have observed that the pine always selects a loose sandy soil, which not only affords it a larger growth, but allows its roots to extend to great distances, thereby affording greater security in gales of wind. The more hardy spruce will 5 send its roots in the narrow crevices of rocks, and cling to a footing where other plants would fall before the breeze. The sand along this road lies directly on the rocks of the coal measures, and often forms collections of considerable depth. On a branch of the Petitcodiac called PollettRiver, and about six miles form the main road, there isan outcropping of coal, which has been intersected by theravine giving passage to that stream. The coal has beenemployed by a blacksmith in that neighborhood, and I regret that I was unable to devote sufficient time, and expense, to ascertain the probable quantity there deposited. I observed a quantity of the argillaceous oxide of iron (clay iron stone) not far from the coal, and it is probable that there is a sufficient quantity of those valuable minerals in the vicinity of this river, at least to support an iron foundry. But considerable time and labour would be required for their full discovery and development. The subsoil in this part of Westmorland is light and sandy, having been derived from the sandstone placed beneath. Blocks of granite, syenite, and porphyry, are common on the surface, and seem to increase in Frequency as the road diverges towards the mountainous land situated a few miles from the coast of the Bay of Fundy. Among the pines I observed a number of red bellied woodpeckers, the Picus Carolinus, a rare bird in Nova Scotia. They are covered with a beautiful plummage, but are very destructive to the groves of pine, as this kind of wood offers but a feeble resistance to the horny beaks of these industrious animals. Between Nixon's and Holstead's Inns, there are some good farms, and instead of the marshes formed by the influx of the sea, The Peticodiac passes through a band of intervale formed in the course of past ages by loose soil, and decayed vegetables, swept down by torrents of rain descending from the neighboring hills. Pursuing its course in a westerly direction, the new red sandstone, four miles northwards of Holstead's Inn, forms a long belt of rising ground called ""Butternut Ridge"", on which there are several new and flourishing settlements. The red marly rock at this place contains beds of limestone, gypsum and rock salt. Several springs take their rise, and send forth large quantities of water highly impregnated with the saliferous mineral. The importance of these deposits to agriculture should not be overlooked, and the design of the Creator of the Universe in supplying salt far from the briny waters of the ocean, and granting lime to enrich the soil are among the exalted acts of his allwise Providence. The limestone contains the remains of numerous

St. Croix Courier - May 20, 1875 Important Discovery Near St. Andrews.- At Bay Side, parish of St. Andrews on the lands of Mr. Joseph Mears, a salt or rather several salt springs within aradius of twenty feet has been discovered. The Basin from which these springs originate is of an extensive area, and the flow from the largest orifice is over twenty gallons per minute, the brine yielding full six per cent of chloride of sodium of an excellent quality, equal to the best Liverpool salt. The formation on either side of the basin in which the springs are situated, is of Devonian age, and rises prominently on each side of it. The basin itself is a deposit of marly clay, blue striated and stratified, deposited in a synclinal fold, probably from the ocean. On the shore, at the thin part of the wedge shaped deposit of clay marl, the springs burst through the gravel bottom giving full vent to their flux. Samples have been sent to the United States, and have proved so satisfactory, that a party of gentlemen are to visit the springs with the object of seeing for themselves, and if satisfied with the prospect, to form a company and at once commence the manufacturing of salt. A sample of the salt can be seen at the office of this paper. It is claimed that it possesses all the qualities required for butter salt. The present sample was hurriedly prepared, but under a slower process the crystallization will be perfect."

S.J. Standard - Jun. 8, 1910 Peat Bogs Great Provincial Asset. - Dr. G.F. Matthew Gave Instructive Lecture at Natural History Meeting. - Rockwood Bog 8,000 Years Old. - ... Dr. G.F. Matthew gave the address of the evening which was on the History of Rockwood Bog which fills a small valley of Rockwood Park. He referred to the bog as one of the most ancient monuments about our city. Portions of it were, in formation, coeval with the Nativity and others with the dynasty of the Pharoahs. The bog, about eight feet in depth, Dr. Matthew concluded, took about 8000 years to form. Remains in this eight feet of bog indicate successive layers of sphagnum and other mosses, grasses, etc., showing moist climate conditions, of forest growth showing drier conditions, and thin layers of charcoal which indicated forest fires. A cedar tree which formed a basis for Dr. Matthew's calculations showed rings of growth indicating an age of 400 years. ... Wm. McIntosh spoke of the economic value of bogs and expressed the opinion that New Brunswick had in its peat bogs a natural asset of more importance than its coal deposits. It was estimated that the peat bogs of the United States were worth $58,000,000,000 and Canada had greater peat deposits than the United States. In Sweden and many American states, he said, peat was now being manufactured into briquettes and sold for fuel for manufacturing purposes. In Illinois the peat manufacturers extracted enough nitrogen from the peat to pay the cost of preparing it for fuel and the briquettes which sold for $12 per ton represented clean profit. He thought it was possible for some enterprising capitalists to make fortunes out of the peat bogs of New Brunswick."

Royal Gazette - Aug. 29, 1888 Notice. Notice is hereby given, that application will be made for Letters Patent by the undersigned, under The New Brunswick Joint Stock Companies' Letters Patent Act for incorporation as follows:- 1. The proposed corporate name of the Company is The Moss Litter Company. 2. The object for which incorporation is sought are the following:- The sale and purchase of real and personal property, and the right to acquire by purchase, lease or otherwise, the right of securing, raising, getting and working of Mosses and Lichen; the right to prepare, manufacture, ship, and deal in Mosses and Lichen for Litter and other purposes; the right to buy and sell merchandise, and to carry on a general business in Mosses and Lichens, with all powers incident thereto. 3. The office or chief place of business is to be in the City of Saint John, in the City and County of Saint John. 4. The amount of the Capital Stock is $100,000. 5. The number of shares is be 1,000, of $100 each. 6. The names, addresses and calling of the applicants, (of whom the first three named, that is, Robert Wiseley, William B. Wallace and G. Clowes Carman, are to be Provisional Directors), are as follows:- Robert Wiseley, of the City of Portland, in the City and County of Saint John, Chamberlain. William B. Wallace, of said City of Portland, Barrister- at-Law. G. Clowes Carman, of the Parish of Musquash, in said City and County, Farmer. Warwick W. Street, of the City of New York, in the State of New York, Broker. T. Clarence Wallace, of Englewood, in the County of Bergen, in the State of New Jersey, Clerk."

Codes: SPRI / IDX_Names: Mineral Springs;
EastportSentenil - Sep. 4, 1824 A small quantity of the Water from the Mineral Spring which has been discovered on the Schoodic at the village of St. Stephens, was lately brought by a gentleman to this City, for the purpose of being subjected to a chemical analysis. It is found to strongly impregnated with sulphurretted hydrogen gas and iron; but the exact proportions of its ingredients have not yet been fully ascertained. The investigation is at present going on, and the result will be made known hereafter. - St. John Star."

Weekly Observer - Nov. 18, 1828 and Nova Scotian - Nov. 26, 1828 Salt Springs, Parish of Hampton. - Most of our readers, probably, are aware that there is a new settlement about 30 miles from this city, which is known by the name of Salt Springs... But the objects of greatest curiousity and interest in that quarter, are the Mineral Springs, from which the settlement derives its name. They are situated four miles from Mr. Barnes's Mill, up the valley or glen through which winds the North Branch of the Hammond River. The largest of these springs is on Mr. Campbell's property, situated on a gentle declevity about a pistol shot from the river. This spring, with its pond, is encircled by a raised mound of earth, in the form of ahorse shoe, and has the appearance of having been anciently formed by artificial means. The pond is about 20 feet wide; at the upper end rises the principal spring in a perpendicular direction through an aperture six inches in diameter, and down which a straight stick may be pushed a considerable distance without meeting resistance, but on withdrawing it a singular gurgling noise is heard. This Spring may discharge about 300 gallons per hour. - A little farther up the stream, near a Saline Spring on Mr. Stewart's property, there rises in the bed of the river a hot spring which effects the passing current with a suitable warmth. Indeed so many Saline Springs discharge their streams into the river in this neighborhood that the taste of the water is perceptibly affected at Barnes's mill-dam. The specificgravity of the water taken up at the largest Spring, has been found to be 1.019 at temp. 62 of Fahrenheit's scale, and to hold in solution Muriet of Soda, Magnesia, Alumina and Lime. This specific gravity will contain in solution 1/32 of these different saline ingredients. The draught acts as a mild aperient, taken by the single tumbler, and though it is not particularly disagreeable to the palate, yet it must be allowed that a relish for it is quite an acquired taste. These Springs were first discovered by the hunters of Moose, such animals generally frequenting these Mineral waters in the fall of the year. It is highly probable that there are Salt Rocks at no great distance, and the North-East direction in which the ridges are observed to run would indicate that the Springs above described proceed from a continuation of the strata which present themselves in the Parish of Sussex Vale, where Table Salt is manufactured and brought in considerable quantities to this City, and which is deservedly esteemed for the beauty of its appearance, the fineness of its granular texture and the adaptation for domestic purposes.""""

Codes: SPRI / IDX_Names: Mineral Springs;
Morning News - Aug. 3, 1853 and Miramichi Gleaner - Aug. 6, 1853 Mineral Spring. - A gentleman has discovered a mineral spring in the county of Kings - about 13 miles above Hampton. The water is said to possess all thepeculiarities, both as to taste and properties of some of the celebrated American Springs and the parties interested intend having some of it chemically tested - and if it comes up to their expectations, they propose to form a joint stock company for the purpose of establishing a country ""watering place"", after the style and fashion of Saratoga. According to Mr. Beattie's survey the Railroad will pass near the place."

St. Croix Courier - Nov. 1, 1854 Mineral Spring. - We understand that a valuable minerals spring has been discovered on the farm of Mr. Robert Purvis, at Bocabec, about a quarter of a mileabove the Bridge at the St. John road. It is supposed to proceed from a mountain and comes out at the side of the Bocabec River. The water has been analyzed by Mr. Foulis of St. John, who states that the water holds in solution - ""carbonic acid, iron, sulfuric acid, magnesia, muriatic acid, lime a trace. It is probable that the water contains iodine; the mineral spring may be considered saline, and its waters diuretic and cathartic from the magnesia salts contained. It may also be ranked as a chalybeate from the iron the water holds in solution."" The spring is likely to prove a valuable medicinal spa water for the curing of many diseases."

Eastport Sentenil - May 26, 1875 Salt Springs. - The St. Croix Courier says that several salt springs have been discovered near St. Andrews, N.B., the largest of which yields twenty gallons per minute of brine which yields six per cent of excellent salt. A party from the United States are to visit the springs with a view of organizing a company for the manufacture of salt if it promises well."

S.J. Daily Telegraph - Aug. 5, 1879 Mineral Spring. - The number of visitors who of late have been going to the Mineral Spring in the Parish of Kent, has necessitated the running of a coach once a week. Howard Giberson, of Bath Station, has procured the necessary conveyance."

Bay Pilot - Aug. 21, 1879 and S.J. Daily Sun - Aug. 23, 1879 Salt springs. - These valuable springs, several in number, and within a radius of 30 feet are situated at the Bay Side, Parish of Saint Croix, on the lands of Joseph H. Mears, Esq., and distant about 9 miles from the town of St. Andrews. They are found issuing from beneath a bed of clay-marl which covers a large area of land. The estimated flow of brine or Saline waters being 20 gallons per minute having a strength of from 5 to 7 per cent. for salt of a beautiful white color, very strong, yet sweet and free from earthly impurities, and is considered to be equal to the best Liverpool Salt for domestic purposes. The formation around this marl deposit and springs is Syenitic granite, Feldspathic porphyry, Trap, Hornblende, etc. (Silurian age) - overlapping the sandstone which is seen to the south, and of a more recent date Devonian. The facilities for the manufacture of salt at a cheap rate are good; wood in abundance, can be obtained at a low figure, no land transit, good harbor, and a great quantity of the salt made would be readily taken away by the fishermen, who could load from the works into their vessels by erecting a little stage, makes it an investment that will give a large return, for the outlay of capital required to develop it. By boring down into the beds there is no doubt but that a brine of equal strength to the Syracuse and Goderiche (which is near 24 per ct.) will be met with here; as the great flux of brine constantly flowing and saturating itself to such an extent as 7 per cent.; must either be flowing over or through an enormous bed of salt beneath these marls, in order to maintain the strength, which it does. From a brine of 24 per cent. salt can be made at the Bay Side springs for 7 cents per bushel. The cost of the works for carrying on salt making on a moderate scale, will be a mere nominal sum and being an article for domestic purposes, it can be easily prepared for the higher branches, where needed, and the crude will meet a ready sale among farmers for Agricultural purposes. J.B."

S.J. Daily Telegraph - Aug. 26, 1879 Carleton County. - Mineral Spring. - It is said that as many as 100 persons per day visit these springs, and some days there have been as many as 150. Should this continue the people of the parish of Kent will enjoy a Saratoga of their own."

Daily Telegraph - Nov. 15, 1879 The Monquart Mineral Springs. - We have received descriptions of the curative properties of this spring, which are really surprising. We shall endeavour shortly to place some of them before our readers. The spring is situated on the Monquart River, near Bath, on the New Brunswick Railway, southeast of Johnville and northeast of Glassville. It is on Government land, and it might be well for the proper department to assume control of it, and sell it to persons able and willing to put up the necessary buildings and protect the spring, which is only a small one, from being either polluted or destroyed. A friend has favored us with an analysis by a leading chemist of the solid matter contained in one gallon of it, which discloses marvellous results. It is as follows: - Grains Chloride of sodium ... 19.150 Sulphate of soda ... 12.140 Carbonate of soda ... 123.351 Carbonate of iron ... 14.030 Carbonate of lime ... 17.295 Silica, alumina and trace of magnesia ... 49.882 – Total grains in solid matter 335.357 This must be pronounced a very rich mineral water."

Codes: SPRI / IDX_Names: Mineral Springs;
Daily Telegraph - Nov. 19, 1879 Our Own Mineral Waters. - The Monquart Stream and its Properties. - During the past summer I have paid several visits to the somewhat celebrated mineral spring on the Monquart River, and will now give the readers of the Telegraph the benefit of my observations. The spring is situated on the Monquart River, about seven miles from its mouth and five from the St. John River at Pearson's siding, on the New Brunswick Railway. Its location, is very beautiful, as is the surrounding scenery. A most curious fact is that within a distance of six feet from this spring arises another whose waters are cool, clear and perfectly pure and tasteless. They both shoot up their waters from a perfectly level tract of land immediately at the base of a steep terrace. This level is about twenty rods in width, and extends to the river's edge, being covered with a large and handsome growth of trees, forming a natural park. Back from the spring about two feet the land rises in a steep ascent, for 20 feet or thereabouts, then extends further back on a level for about the same distance, where it again rises with a more gradual ascent and extends back on a much wider level. Standing upon this upper levee, one can look down through the opening in the woods, made by the road, and see the bright river rippling and glancing in the sunlight, as it flows on its way to the St. John, of which it is a branch, while between him and the river, among the trees, on the lower flat, numerous white tents and gay dresses are seen, in strong contrast to the surrounding green of the forest, varied by a few rough board houses and the omnipotent photograph saloon. There are two ways of reaching this beautiful spot from the New Brunswick Railway, one from Bath Station, and the other from Pearson's siding, the former being distant seven miles and the latter five. These roads are in equally good condition and can be travelled over with great ease, either by the heavy country wagon or the lighter buggy or carriage. Wonderful cures. - Several cases of the benefit arising from the use of this water have come under my own observation. One is that of a young lady, a clerk in one of the departments in Washington, who had come there; her face almost disfigured by some cutaneous disease. She had been there about a week when I first saw her, and, upon my inquiring if she had received any benefit from the use of the water, she said that her face was so much improved and her general health so much better that she had applied for an extension of leave. She further stated that she had tried all the celebrated springs in the United States and received no benefit from any and had given up in despair until hearing of this she thought she would try it, though with little hopes of receiving any benefit. When I last visited the spring, I heard that she had left with the sores entirely healed and hardly a scar remaining. Another case is that of a gentleman, who has built a small cottage on top of the first terrace, and has had his family with him spending the summer there. The answer I had from him, when I inquired if he received any good effect from the use of the spring, was: Why sir, it is worth over a thousand dollars a year to me. My children have been tormented with scrofula, while I have been a martyr from indigestion, now we are as well and happy as possible. I shall keep a store and some provisions in my house and pay it monthly visits during the winter. But I fear, he continued, that the place will go to destruction; there is no one to take care of it. The land on which the spring is belongs to the Government and no one will go to any expense. The spring is but a small one and requires great care, and at present it is a very muddy and disreputable state. How They Come. - I made it a point after this to pay particular attention to the manner of the different persons coming to the spring for water, some would come with dirty pails, jugs, bottles, etc., and instead of using the water from the other spring to rinse them would use the mineral water, which was then emptied out in close proximity to the spring, and as the surrounding ground was naturally soft this made the surroundings very muddy and diagreeable. Sometimes boys would come and continue pumping the water upon the ground until the spring was dry, and often horses would be led up to the spring to drink. Now I believe that this spring might be made a very valuable addition to the two settlements, between which it is situated, Johnville on one side and Moose Mountain settlement on the other. If the land and spring were sold to some wealthy and enterprising man, who would guarantee to build a hotel and keep the place in good order and had the means so to do, there would be such a rush to it that one hotel would be insufficient to accommodate the visitors and others would spring up on the neighboring land, speedily giving these two settlements a market for their produce at their own doors. Some of the residents near the place told me that the Government intended to sell the land but reserve the spring, and a few acres of land around it, for public use. How the Spring Might Be Preserved. - If the Government would build a large hotel, erect a house over the spring and furnish the luxuries required by wealthy persons who are in the habit of visiting such places, this would be all very well, but if not then things would remain in statu quo and the place would still be a mud hole and the neighboring people would still come there to spend a Sunday, or camp

out for a day or two, bringing their own provisions with them and leaving no money in the place and, not having remained there long enough, receive no benefit themselves, and the use of the waters would still be denied to those who really require it and whose enfeebled constitutions forbid their living such a patriarchal life as those who now visit there are compelled to do. It might be said that if the place fell into the hands of one man the poor would be debarred from the use of the waters, but one moment's consideration would show that this would not be the case, for the use of the waters is his advertisement and as soon as he would cut that off his business would cease. Indeed for that matter a condition could be embodied in the grant, that the public should be allowed to drink the water. This would leave the spring itself sufficiently under the control of the owner to allow of his protecting it and seeing that the waters were not wasted, though I cannot see the necessity of such a condition. Surely the granting of this lot and spring to some such man as I have mentioned would be of much more value to the country in which it is situated than a hundred of the free grant lots, which bring in a class of settlers that cannot possibly for many years be of any service to the country. I think there would be no difficulty in finding the man to purchase, then visitors would rush there, mills would be built and business would flourish, and prosperity reign in those two settlements such as no others in our Province enjoy at present. I hope that the Government will consider this matter before acting in a way that may put it out of their power to give the surrounding settlers the benefits that would accrue to them from a proper management of this valuable spring. During one of my visits to the spring there were camped around it nearly three hundred persons; but as there was no place of accommodation, these were compelled to bring their own provisions and forage, thereby leaving no money behind them, and also being compelled to leave as soon as the limited stock that they could carry with them should be disposed of. This is no imaginary fountain of eternal youth. The two cases which I have cited of persons receiving benefit from the waters are only two out of hundreds; and many persons, to my certain knowledge, have been compelled to remain away, though extremely anxious to go, simply from want of a place of residence while there, and from hearing of the filthy condition of the surroundings, which must necessarily be where so many congregate, with no one to look after the cleanliness and order of the place. X."

Codes: SPRI / IDX_Names: Mineral Springs;
St. Croix Courier - Nov. 27, 1879 A wonderful mineral spring has been discovered on the Monquart River, a tributary of the St. John, about five miles distant from Pearson's Siding on the N.B. Railway. Marvellous cures of scrofula, indigestion, and other ills to which flesh is heir, are effected by a free internal use of its magic waters."
Carleton Sentinel - Sept. 10, 1879 A Visit to The Mineral Springs. - On the morning of the 6th inst., in company with two friends, we left Grafton for a visit to the Mineral Spring, stopping at River Bank over night we completed our journey the following day. The wonderful Spring is located on the right branch of the Monquart Stream, about six miles from its mouth. Since the discovery that it possessed medicinal properties, it has been visited by large numbers of people many of whom, came long distances to try the efficacy of the waters. A year ago the Spring was a mere mud hole, but since then Dr. Cox, besides clearing several acres about it, has sunk a barrel over it and laid a convenient walk to it, therefore, taking into consideration, the shortness of the period since any improvements have been commenced, visitors should not be surprised at the crudity of the place. The mineral water has a smell and taste considerably like gunpowder, while some have the effrontery to say like stagnant water. For salt rheum, scrofula, and lung diseases it is said to be good; as also a sure cure for the itch and, by application of the mud, will permanently remove warts. Persons troubled with dyspepsia and biliousness have told us that for these diseases the water has proved an effectual remedy. The land about the Spring being somewhat boggy, on a peat clay, a dampness or fog seems to settle over the place and as it was such at the time of our arrival, we secured a tent on the hill at the foot of which is situated the Spring. From this table land the observer obtains a fine view of the surrounding country. The scene is truly a panoramic one; below can be seen the babe, the youth and the maiden, the old man and the old woman, all drinking eagerly of the efficacious fluid, as if the whole of their future welfare were centred in this one Spring, while the surrounding hills, with their forest crowned summits, seem to look down upon the scene with a cheerful and protective lair. While thus, as it were, dreaming or. more properly, feasting upon the sumptuous and rare treat before our eyes, we hear a familiar voice behind us and turning around, have the pleasure of meeting our friend, Mr. Henderson, of Upper Woodstock, who, with his family, is seeking health and happiness in the magic water of this healing spring. We had no chance to dream any more then, for being a genial, sunny-tempered, friendly gentleman, Mr. Henderson made his presence like the sun shine. And now, kind editor, I am sorry I cannot write you any more, for Saturday afternoon we packed up, secured our jug of mineral water and bid adieu to the Mineral Spring. Let me urge you all, young and old, to make personal application of this remedy to yourselves. Go to this Sifoam, wash ye all and be clean. A.S. Grafton, September 10, 1879."

Bay Pilot - Sep. 11, 1879 and S.J. Daily Sun - Oct. 4, 1879 Salt Springs. - To the Editor of the Bay Pilot: Dear Sir:- In compliance with your request for further particulars respecting these springs, I beg to submit the same at foot. The bed of marl exposed is about 1/4 of a mile wide and 1/3 of a mile long, where it becomes covered with trap and other rocks, as mentioned in my last, caused by volcanic upheavals (which have been very strong and great in this district), thereby covering up this large basin, which has been filled by its great salt reservoir, the ocean. The same saline waters are found flowing on each side of the marl at a distance of one quarter mile from each other, and of about the same strength, clearly shewing an extensive bed of salt. Professor Denton, Ex-State Geologist of Massachusetts, writes: The trap rocks on the shores of the Bay of Fundy are believed to have been formed during the age of the great salt deposits. In October, 1877, the same gentleman writes to me: The salt springs of which you write, must flow Neither from beds heavily charged with salt, or from beds of solid salt, and in either case I think boring would secure a heavier brine, &c. At Syracuse salt works, the brine is pumped from depths varying from 150 to 300 feet deep, 40 gallons of water gives one bushel of salt. Nine million bushels of salt are made from this brine every year, with no apparent diminution in supply. At this place also it is purified by a cheap process by precipitating any foreign matter it may contain, thereby making it an article greatly esteemed for dairy use. 700,000 bushels are manufactured yearly and sold under the name of Factory filled salt. I do not think the Bay Side salt requires any such treatment for domestic purposes, not even for butter which is a delicate test of the presence of impurities, and even if at any time it should be found to contain impurity the process is simple, and the necessary re- agent cheap for purifying the same. At Droitwick, England, one salt spring yields a thousand tons of salt a week. At Goderich and Clinton works 104 kettles yield 100 barrels or 550 bushels daily. Capacity of kettles varying from 120 to 140 gallons. One cord of wood will evaporate from 34 to 36 bushels of 56 lbs. each. Dr. Goessman remarks: 23.4 per cent should yield 52 bushels for the cord of wood. One cord of hard wood equal in salt producing power to one ton of coal. I estimate that the above number of kettles with furnaces can be placed in position for salt making for $3,000, and that large returns can soon be made, which will cover the first outlay, leaving the future one continuous source of profit. There is a beautiful table of land sufficient for the erection of works to almost any extent. The land granted is one mile in length and over one quarter of a mile in width covering this great basin or salt deposit. There are many other material points and features connected with these springs and their surroundings, which can be better explained on the ground; in fact such is necessary that they may receive their full appreciation. The privilege for working the same can be obtained on most favorable terms, John B. Kay St. Andrews, 5th Sept., 1879"

Codes: SPRI / IDX_Names: Mineral Springs;
Carleton Sentinel, Aug. 28, 1880 Mineral. - A prettier ride than that available over the N.B. Railroad from Hartland to its terminus at Edmundston few railroads offer. ... Here flows the Monquart and here is Mineral. This place has been named after the mineral waters that here come to the surface - waters that have a very considerable local celebrity already and are winning a widening fame. - how it was discovered that in these waters there abides curative properties, we know not; indeed we presume that page of its history is largely legendary. It may readily be imagined that some thirsty and weary explorer, hunter or lumberman first discovered, by accident, that there was water here excessively nasty to both smell and taste; medicine and nastiness are to many persons synonymous terms, hence the idea may have been not unnaturally conceived, that this water must be medicinal. The first impulse of the visitor here, now, is to seek the spring. Directed to the place, he finds two barrels, only some five feet apart, and drinking from one he finds a pure, cold, pleasant water, and this cannot be the spring; he tries the other and - well, he is satisfied; the contortion of his countenance in expression more eloquent than words, says, Eureka I have found it - he wants to die or hide himself. This is the fact. With everybody, probably, the first use of the water produces disgust, while after having used it for a few times it becomes palatable, a liking for it soon succeeds, and before long it is used in preferences to ordinary water not only as a beverage but as well for culinary purposes. And this applies to the experience of animals as well as human beings. A friend remarks that his experience with whiskey has been very similar. This does not rank in regard to surroundings and associations with the aristocratic health rendevous of the United States or even of Germany. The assertion is made at a venture, for the writer has never visited Saratoga or the Spas. Matters here are primitive; the chief innovation on nature in the direction of high tone being the planting of a barrel, in which there is sometimes a pump, over the spring. Formerly the patient took the water fresh from the earth, and to swallow a portion of the mud did not apparently lessen the healthful result. The water then, as now, was used for external as well as inward application, and for certain forms of disease a mud bath was considered good. Now some over fastidious mortal - such mortals do infest our species - had his or her sensibilities offended when, having come for a drink, they found the spring being occupied as a bath tub. Hence came the advanced notion of a barrel and a pump. And no one noisely objects, for where's the good, when people are so very particular. Turning from the Siloam of the visitor's hope, he views the artificial surroundings. - And these are abortly told off. A bath house, in which, for a small fee, shelter and a tub and a watering pot - the latter for a shower bath - may be used for bathing; the bath may be hot or cold; that is the bather may fetch the water direct from the spring and use it cold, or he may heat it in a large pot that hangs suspended between two logs over an extemporaized free-for-all fire place. Close by, Mr. W.L. Alterton keeps a shop and dispense groceries and other necessaries - a great accommodation to visitors. In a window in a room above Mr. Alterton's store will be noticed a tangle of female faces, anxiously looking out to see the last arrival announced by the rumbling wheels. One has seen some result of the photographer's art where the features of several faces have been combined, so that the picture, though apparently as of one face, gives the impression of many faces. Just so this window quick life picture. One could affirm it is familiar, and yet so mixed are the familiar features of several ladies that it is hard to identify it. - However, having secured an invitation to visit the room, we see the tangle unravelled and have a hearty welcome from half a score of pleasant acquaintances who here, on an equal number of beds various in quality and arrangement, seek repose at night, and do some little talking by day. Beyond, in the adjacent shrubbery, are tents, varied in size and shape, some occupied by couples, some by large parties. Out on the plain, beyond the croquet ground is Mr. Alterton's neat and commodious saloon, where he takes all who wish to have their lineaments impressed by the camera - as they were when they arrived, sallow, fleshless, debilitated, and again, when ready to depart, as they are, robust and healthy featured. A little beyond is Mr. A.'s dwelling, where his kindly wife must have her patience tried by the consent calls made upon her for hospitable assistance in various ways; truth to tell, however, this lady in the bestowal of her liberal hospitality never evidences a tired patience. In another part of the valley is Dr. Cox's residence, where he advises patients, and with his wife affords accommodation for the hungry and weary. Then adjoining this is a large barn where horses find food and shelter on the floor, and not unfrequently, when there is a rush, men and women

seek rest and sleep on the loft among the hay. Up on a terrace of the western acclivity Mr. Jones, of Blaine, Me., has a neat little cottage - a summer residence for his family. And with a cottage, in which accommodation may be had by the visitors, near the main road, before descending to the valley, and the post office, kept by Mr. Z. Cox, the list of permanent and temporary dwelling places is exhausted. Of the temporaries - the tent dwellings here are transitory. In the morning they may be numerous, while at eventide their occupants may have Folded their tents, like the Arabs, and silently stole away. Dr. Cox was, we believe, the first to put up a dwelling house here; he it was who erected the bath house, for the use of which he charges a very small fee, this being the only item in connection with the use of the water from which he derives any income. The Dr. has been the means of bringing this spring into public notice; he has done whatever has been done to prepare it for the convenient use of the public, and much more he would have done for the public accommodation and his own benefit, but that there has been some dispute as to the title of the land, which he claims. This dispute, it is said, is about settled, and it may be expected that in another season there will be provided such quarters as will render a visit much more agreeable than at present. It is expected and proposed that, as in the past, the spring itself will be reserved for the free use of all who visit it. The aggregate of visitors to the spring annually has for a few years past been quite large in number. Patients have been here from Washington, D.C., from St. John and other remote places, while people belonging to the County in large and small companies come to the healing waters during the summer. It is a general picnic ground. All classes are represented at times. A unity of felling renders the accidental companionship most agreeable. And there are fine opportunities offered for the study of human nature in its inartificial aspects. Round the general fire, the cooks of the several parties assemble before meal time; in vessels of various kinds the tea is distilled, and as various are the vessels used in preparing other food. Beside a clergyman who, with tongs extemporized from two sticks, endeavoring to toast his bread, may be seen an Editor who, armed only with those tongs with which he wields the pen, seeks to so manipulate a Digby chicken on the live coals as to secure its being cooked equally - sure, whatever the result to the herring, to cook his fingers rarely. And again, the worshipful head of a civic corporation tries the culinary art in preparing some toothsome diet. The cooking process accomplished, it is to your tents, oh Israel, and off goes the food, that for the ladies before referred to to their dormitory, for the tent livers to the tents, and other to some merry party who have bivouaced on a green knoll beneath the branches of an ancient tree. Of course cooking is not resorted to very extensively here; home cooked victuals and canned stuff is the chief dependence. But there are trout in the stream, to be had for the catching, and berries in the woods for the picking. To a jolly picnic party about partaking of tea approaches an aged, bent and crippled female; with the accents of modest poverty she asks for a clergyman, who is the life of the party. He comes forward and says, in kindliest tones, Well, sis, what can do for you? She - I have a few berries that I would sell; be charitable. He - Of course, sis; how many and how much? She - What the kind gentleman pleases; and clasps in her trembling fingers the silver coin he bestows. The berries are enjoyed; they are good, and sweetened by the act of charity bestowed. - Not long, however, before it is whispered about that a pleasant joke had been perpetrated, and the assumed cripple, a lady from Woodstock, the perpetrator. In the evenings, sometimes, the barn floor having been prepared, the lovers of that science assemble and enjoy a break down, and thus every day and evening brings some novelty to while away the time. We believe it to be an established fact - established in the happy experience of many who have been cured or helped - that the waters of mineral spring possess some rare curative properties. Their effects have been proved on horses as well as on humans. - Some wonderful cures are quoted by very reliable authority as having been effected by a summer's sojourn here. This being so, the public should be advised on the matter. - And being so, the public

Carleton Sentinel, Aug. 28, 1880 Benton. - As your regular correspondent is absent from this place for a few weeks, luxuriating at the Mineral Spring, at Bath, ..."

Carleton Sentinel, Sep. 18, 1880 A Visit to the Mineral Spring. - So much has been written for the Sentinel about the Mineral Spring, in the Parish of Kent, Carleton Co., N.B., that the public will perhaps think any further remarks on that subject uncalled for; but we think the waters of that Spring have not yet attained the celebrity that their merits deserve. Prompted by a curiosity to see this modern Bethesda, we made it a visit. Leaving the St. John river, three miles above Bath Station, on the N.B. Railroad, we passed through the settlements of Holmesville and Canaan, and at a distance of six miles from the above mentioned river descended a steep bank to the Monquart Stream; passed Dr. Cox's and Mr. Alterton's end, at a distance of a few rods, found two springs - one containing a pump, from which we drew some water, and found it to be the mineral water in earnest, as an Irishman would express it. Having drank nothing since leaving the St. John River, that we might be thirsty when we arrived at the spring, we did it ample justice and found it cool and not unpleasant, with the exception of a peculiar sulphurous odor that has been generally believed to prevail in regions infernal. We saw some persons who could not drink it on account of this odor, but for our part we could without inconvenience swallow a pint of it at any time. Unlike the ancient pool at Jerusalem, an Angel does not come down occasionally to trouble it and make it medicinal, but the demon down under the sea that distills it remains down and attends to his business all the time. We believe, however, that we saw an angel in female form, but without the wings that are generally, but we think erroneously, assigned to angels, come down at a certain season and drink copiously of the water, the water having the effect of making her look still more angelic. There is also a man in attendance to put the impotent in. The efficacy of this water in almost all curable diseases is established by facts beyond the possibility of doubt. People have come here from Washington, D.C., who had tried the mineral waters of the United States and rather grew worse, and after a short stay have gone away completely cured. The rheumatic have come here walking on two canes, and in two weeks' time have been able to dispense with the canes and carry a pail of water. The scenery here, too, is grand; picturesque hills, magnificent trees, murmuring brooks, all form an elysium for the mind of esthetic leanings; and in rapture we thought of our bliss: If fate had but assigned us To live and die in scenes like this, With some we left behind us. We stayed two days and with regret took our departure, feeling quite rejuvenated from the use of the waters and the society of agreeable acquaintances. We passed through the flourishing settlement of Johnville. Behind this we discovered a new colony, wgich we have never yet seen named in print. It is located between Johnville and Glassville, consists of eleven hundred acres of excellent land, and is called Kent-Aberdeen, because it is partly in the Parish of Kent and partly in Aberdeen. The settlers came from St. John last year and are improving their land rapidly, and have some crops that look well. Two miles further we arrived at Centre Glassville, three hours after we left the mineral spring. In conclusion, we would advise all who suffer from any of the ills that flesh is heir to to try the effects of nature's specific, as it flows pure from her own laboratory in the town of Mineral, the Saratoga of New Brunswick. G. Elder September 11, 1880."

S.J. Daily Telegraph - Sep. 11, 1884 Mineral Spring. - The mineral spring at Nortondale, near Millville, York Co., is of late attracting considerable attention, and not a few persons have found their way thither this summer, to try the effects of its waters. One of the party who picnicked at the springs last Friday says a most enjoyable time was spent, and a more charming and romantic spot for picnic grounds cannot be found anywhere in the Province. If there is any virtue in the waters, which many claim there is, it should be more publicly known, and inducements offered to make it a favorite summer resort. The spring is about 8 miles from Millville station on the N.B. Railway. - Gleaner."

Codes: SPRI / IDX_Names: Mineral Springs;
Daily Telegraph - Aug. 20, 1886 A Mineral Spring. - The St. Croix Courier says: - Mr. James Ganong and other enterprising gentlemen are arranging for the development of a valuable mineral spring situated on the line of the Grand Southern railway, between St. George and St. Stephen, and near Lake Utopia."

S.J. Globe - Nov. 1, 1887 and Daily Times - Nov. 2, 1887The Healing Waters of New Brunswick. - Montreal, Nov. 1. - The following editorial appears in today's issue of the Canadian Medical and Surgical Journal, issued in this city: Apohaqui Water. - Recently there has been discovered a valuable mineral spring at Apohaqui station, on the Intercolonial railway. It is an alkaline water, closely resembling in composition the famous Vichy water. The following is the chemical composition as made out by Mr. Best, the government analyst: In 100,000 parts of water there are of Potassium Sulphate … .50 Chloride ... 1.08 Calcium Carbonate ... 1.25 Sodium Chloride ... 76.06 Sodium bicarbonate ... 201.60 Magnesium and Iron ... traces Silica ... .90 Organic matter ... traces — 281.83 It will be observed that, after the sodium bicarbonate, the most important ingredient is sodium chloride. It is well known that sodium takes a most active part in promoting tissue growth and the general metabolism of the body. As Apohaqui water is pleasant to take, being entirely free from either a bad odor or taste, it is admirably suited for the treatment of those very common deranged nutritional states arising from chronic gastric and intestinal dyspepsia. It fulfills the prominent indications in the treatment of lithaemia. From its composition, we should judge that it will prove serviceable in that numerous class of cases of chloro-anaemia where iron and its cogenors are not tolerated until the gastric and intestinal mucous membranes are restored to a normal condition. Apohaqui water also possesses the valuable proerty of emulsifying oils, especially those of the fatty kind. Added to cod-liver oil in equal parts, it forms a perfect emulsion. This emulsion has now been employed in the Montreal General Hospital for some time back, and gives great satisfaction. From a considerable experience of its use as a vehicle for the administration of cod-liver oil, we feel confident that it will replace all other agents used for this purpose. In the administration of this emulsion it is well to remember its alkaline properties, and that therefore it should be given some time after the meals - about that period of digestion when the contents of the stomach are making their way into the duodenum; that is, from an hour and a half to two hours after eating. By giving it at this period there is more certainty of its being quickly absorbed, and therefore less liable of interfering with gastric digestion. For lithaemic and gouty states, it had better be administered on an empty stomach. For acid dyspepsia, a short time before meals."

Kings County Record - Nov. 11, 1887 Our Mineral Resources. - We are glad to notice that a scheme is on foot to convert Reed's castle, as it is called into a summer hotel and to establish in connection with it a sanitorium at the Apohaqui mineral springs. We cannot but wonder that more attention has not been extended to the various mineral resources of this country. The medicinal properties of the spring referred to at Apohaqui are slowly but steadily forcing themselves on the public notice. It has been known for many years that deposits of salt which for excellence of quality, is not only surpassed, but has no equal in the world. Yet, these properties lie wholly unimproved and can scarcely be said to be opened. It cannot be want of capital, considering that the Saving's bank in this village has over $100,000 on deposit. What then can it be but want of that push and energy which alone can develop our country as it ought to be developed. There are extensive deposits of gypsum, manganese and other minerals, all awaiting the opening 'sesame' of the energetic capitalist to yield up their rich treasures. A great writer has said that 'man's best things lie close about his feet.' Would it not be better for us instead of looking altogether to some political panacea for wealth, to seek it in the sources lying right at hand. Whatever governments may do or be, nature has been bountiful and let us thankfully accept and utilize what she has in such richness bestowed."

S.J. Globe - Nov. 26, 1887 Mineral Waters. - Mr. John R. Smith has received the diploma awarded him at the Toronto Dominion Exhibition for the famous Apohaqui mineral waters."

Moncton Daily Transcript - Apr. 10, 1888 Several more mineral springs have been discovered in Kings County. The properties of the water, it is said, are similar to those of the Apohaqui springs. Mr. W.F. Best, who made an analysis of the samples believes the discovery will prove of considerable value to the owners."

Daily Telegraph - May 5, 1888 Another Mineral Spring. - King's county is rising into considerable prominence by the recent discoveries of mineral springs. The Apohaqui spring is well known and is said to be paying those interested in it. Another valuable spring has been discovered at the Portage near Anagance, on the farm of a man named Dunfield. An analysis of the water proves it to contain a considerable percentage of sodium potash, calcium, carbonates, sodium, chloride, iron, silica and, also, sulphurated hydrogen gas. These substances in smaller proportions, are found in a number of the celebrated springs of Europe."

S.J. Globe - May 5, 1888 Another mineral spring, possessing medicinal qualities of high standard, has been discovered near Anagance, Kings Co."

Daily Sun - Apr. 1, 1889 There is a prospect that a company of American capitalists will take hold of the Apohaqui mineral springs."

S.J. Evening Gazette - Apr. 1, 1889 It is rumored that the Apohaqui mineral springs are to pass into the hands of an American syndicate."

Codes: SPRI / IDX_Names: Mineral Springs;
Kings County Record - Aug. 23, 1889 In Charlotte Co. ... It is rumored that the mineral springs of Pennfield will also be bought by a syndicate, and fitted up as a watering place."

Daily Telegraph - Jun. 14, 1889 A Valuable Medicinal Spring. - Attention is directed to the advertisement in another column of a valuable mineral spring at Havelock, King's county, the property of Mr. Wm. Keith. The spring is located in the heart of a thriving and beautiful rural district, close by the village of Havelock, and within easy railway connexion to the outside world. The region round about is elevated and healthful, and a better site could not be found in this province for a hotel to accommodate the hundreds who will no doubt resort to the spring when the merits of the waters are more generally known. The analysis of the water made by Mr. Best, of this city, show them to contain most valuable ingredients for curative effect in the human system, and better than this is the fact of cures already effected and cheerfully certified to by a local physician, notwithstanding the natural reluctance of the medical faculty to endorse other curative agencies than those laid down in their books. There is no reason to suppose that the waters of Vichy, Baden, Bath, Banff or Saratoga, are one whit better than those of our own province, not that any of these surpass or equal those of the Havelock spring. The waters of this spring give a mild sperient and alterative effect, and have proved of undoubted efficacy in the prevalent kidney complaints, and especially for skin diseases. There is also an extensive deposit of mud about the spring, affording every facility for the establishment of mud baths, such as have been employed with great advantage in the treatment of many physical complaints. The Telegraph would be glad to see the Havelock Spring, which is offered for sale, taken hold of by capitalists and developed. It apparently affords a promising chance for the realization of large returns for money invested."

Daily Telegraph - Jun. 14, 1889 ADVERTISEMENT: To Capitalists. The Celebrated Havelock Mineral Spring For Sale. The undersigned offers for sale the Havelock MineralSpring, 66 miles from St. John, on the Havelock Branch of the I.C.R. For particulars as to quality of water, its success in the cure of diseases, analysis, and terms of sale, apply to Wm. Keith, Havelock, Kings Co. P.S. - The water is now on sale at H.W. Barker's, A.C. Smith & Co.'s and at Parker Bros., St. John, where analysis and certificates of cure can be obtained. Will soon be placed at Moncton and Sussex. Can also be had at Havelock Station at six dollars per barrel. Wm. Keith."

Kings County Record - Mar. 29, 1889 Mr. J.R. Smith, of St. John, N.B., has recently been to New York in connection with the mineral spring at Apohaqui, in which he has an interest. We hear New York capitalists are about to erect a hotel at these springs."

Daily Telegraph - May 2, 1889 Mineral Springs. - The secretary of the Board of Trade has received several communications from parties interested in New Brunswick mineral springs, and would be pleased to place the writers in communication with the owners of any springs that might answer their purpose. Owners of springs should send samples of the water fresh from the spring, or an analysis, to the secretary at once. Also state price and location of property. Alkaline waters are mostly sought after. These should emulsify cod liver oil and are easily tested by mixing one quarter of oil to three quarters of water; on this being well shaken it should form a creamy substance."

Daily Sun - May 2, 1889 Mineral Springs - Persons throughout the province who have mineral springs located on their property should place themselves in communication with the board of trade at once. Through the reference made to New Brunswick springs in the city advertisements which appeared in the special number of the Sun, the secretary has now inquiries for springs, the water of which will emulsify cod-liver and other oils. Correspondence is useless unless the owners send a correct analysis of the water, and price of property."

Kings County Record - Oct. 4, 1889 The Havelock Mineral Springs. - We have from time to time made mention of the vast amount of minerals, ore, etc., that we believe will some day prove to be the greatest source of income to our county. We have not said anything about the many mineral springs to be found throughout the county, nor have we mentioned the money that there is in one of these springs when properly handled. We now propose to call the attention of our readers to the far famed Havelock mineral spring which is situated about a quarter of a mile from the Havelock railway station in the midst of a beautiful country, and near which is an elegant site for a summer hotel or sanitarium similar to those at the Poland Spring. Right here we might say that this water is of equal value to the Poland or Saratoga waters and the time is approaching when our people will recognize its efficacy in the cure of all skin diseases to such an extent that instead of patronizing the Poland or Saratoga springs they will flock in large numbers to Havelock, for in the water of this spring can be found a cure for Salt Rheum, and all skin and kidney troubles. The water is slightly purgative in its nature and has a tendency to restore the natural power and functions. It has been pronounced to be the equal to any of the European and American waters. The nearness to the railway makes it easy of access, and when in the near future, as no doubt there will be, a large hotel erected near the spring, it will prove a valuable summer resort as the neighborhood abounds in trout creeks, and the woods are well stocked with partridge and other game. Another point that we had nearly forgotten are the medicated mud baths that can be provided for all who desire this mode of cure; the mud deposit close by the spring being highly impregnated with the curative ingredients that give the Havelock water its high name."

Codes: SPRI / IDX_Names: Mineral Springs;
Daily Telegraph - Oct. 19, 1889 Havelock's Great Mineral Spring. - To the Editor of the Telegraph:- Sir: As I chanced to be in this village for a short time, I thought it might be interesting to your readers to have a few notes from me with reference to the chief local attraction - the Havelock mineral spring. The spring is situated in the midst of a fine agricultural district, with just enough of the original forest visible on the hillsides to add a charm to the scenery. A healthier place than Havelock it would be difficult to find. The air is pure, and the water is excellent. A railway brings the traveller to within a mile of the spring, and a good road, and one of the fast roadsters of the district carries the visitor and his baggage to the spring at a 2.40 gait. When you get to the spring you find a large body of sparkling water pouring up from the earth in a never ending stream - the same volume in summer and winter. Drink the water and you notice a slight mineral taste, not unpleasant, decidedly the reverse, for one does not wish to stop drinking after the first glass. Some of the people who live in the vicinity go a long distance out of their way to get a drink of the water. It acts as a very mild purgative when taken internally in proper quantity, and when applied externally it is certainly very beneficial in cases of salt rheum and similar eruptions on the skin, and glands. The owner of the spring is accumulating quite a volume of testimonials from persons who have derived benefit from the use of this water. Some time a real live Yankee, with an eye to the main chance, will come along and buy the property, put up a mammoth hotel, advertise the spring and make a fortune, besides bringing to the notice of suffering humanity a cure for some of the ills that flesh is heir to. In the immediate vicinity of the spring is a large deposit of black mud, impregnated with the mineral matter from the spring. This mud could be utilized for what are known in Europe as mud baths, found to be very beneficial in the cure of certain diseases. I omitted to mention that the surveys now being made for the Harvey Salisbury Short Line show that the road, when built, will pass within a few miles of the property, and thus bring the great spring 50 miles nearer to the United States and western Canadian people. Traveller. Havelock, Oct. 17."

Daily Times - Sep. 20, 1889 Havelock Mineral Spring. - A Great Remedy for Saltrheum and Various Diseases. - In the booth of the A.A. on the exhibition grounds there is being dispensed some of the famed Havelock mineral water. This medicinal remedy is being put on the market and some wonderful results are related of its curative powers. The water is got from a spring, which runs about 30 barrels per hour, in the vicinity of Havelock railway, the latter connecting with the I.C.R. The site is a good one for a hotel, the surroundings being one of the prettiest in the province. No doubt in the near future there will be a sanitarium erected there. The water from the spring has been used with marked success in salt rheum and various skin diseases, and is also a remedy for constipation and other derangements of the digestive organs. There is a large local demand for the remedy and teams are constantly going to the spring for the modern elixir. Mr. William Keith, the proprietor of the concern, has a number of testimonials of persons of undoubted veracity. It has been analyzed by W.J. Best, proving it to contain rare medicinal qualities. A short distance from the spring there is a large deposit of black mud, used for baths, and also said to be of a very curative nature in certain diseases. The Messrs. Masr (?) have the mineral water for sale."

Daily Sun - Sep. 26, 1889 Havelock Mineral Spring. - William Keith, proprietor of the far famed Havelock mineral spring, placed its waters before the public in a liberal way at the recent Moncton exhibition, large quantities being dispensed free from the booth of the A.A. on the grounds near the main exhibition building. This water has earned it a lasting reputation for its cures in cases of salt rheum, troublesome and unsightly affections of the skin and derangements of the digestive organs, and Mr. Keith is working to secure the establishment of a hotel or sanitarium at the springs. The location has many attractions for pleasure seekers. It commands a view of beautiful farming districts and first-class hills. The air is remarkably pure, and there are no marshes, swamps or miasmatic lands in Havelock. The neighborhood abounds in trout brooks, while the woods are well stocked with partridge and other game. The springs are but a quarter of a mile distant from the Havelock railway station, and a hotel there would be in direct railway communication with the entire continent. There is also another point in which the Havelock springs excell Saratoga, in that medicated mud baths can be provided for all who desire that method of cure, the mud deposit close by the spring being highly impregnated with the curative ingredients that give the Havelock water its high name. A better site for a sanitarium does not exist in Canada."

Daily Times - Jul. 15, 1890 Mineral Water. - S.R. Hunter has been appointed agent for the celebrated Havelock mineral water. CERTIFICATE OF ANALYSIS. CHEMICAL LABORATORY, 74 GERMAIN STREET, ST. JOHN, N.B. Wm. Keith, Esq. April 15th, 1889 Dear Sir, - The following is the analysis of the mineral water from your spring at Havelock: In one Imperial Gallon. Grains Magnesium biCarbonate ... 84.55 Sodium Chloride ... 35.15 Calcium biCarbonate ... 19.20 Sodium biCarbonate ... 12.44 Potassium Sulphate ... 8.27 Calcium Sulphate ... 1.46 Sulphur ... 0.09 -- 161.76 With traces of Iron, Iodine and Silica. The keeping quantities of the Water are excellent, samples having remained unchanged in my laboratory

Daily Telegraph - Jun. 10, 1891 ADVERTISEMENT: Havelock Mineral Water. In order to introduce this valuable water, sample five gallon jugs will be supplied (for the cost of the jug), also in casks. Some remarkable cures have been made by the use of this water in cases of Eczema, (Salt Rheum), and other Skin Disorders. Also in Cases of Constipation, &c. Where all the ordinary remedies have failed this water has cured. Circulars containing certificates, &c., sent on application to Wm. Keith, Proprietor Havelock Mineral Spring, Havelock, N.B. P.S. - Arrangements can be made for the purchase of this spring or a part interest in same."

Daily Telegraph - Jun. 10, 1891 Havelock Mineral Springs. - Attention is directed to the advertisement of this remarkable mineral spring, which appears in today's issue. Nothing but a little enterprise and capital is required to attract a crowd of sufferers to the charming village of Havelock to take advantage of the remedy from nature's laboratory."

Codes: SPRI / IDX_Names: Mineral Springs;
Daily Telegraph - Nov. 4, 1891 Mineral Spring. - Messrs. Best & Gemmel have had sent in to them samples of mineral water to be analyzed. It is understood that this water was known to the Indians, many years ago, and was used by them for certain diseases. A prominent city druggist has taken the matter in hand, and will introduce the water to the public

Evening Gazette - Nov. 19, 1891 Mineral Water Spring. - Dr. J.E. March has leased the mineral water spring on the premises of John Gallagher about six miles from Apohaqui, on the old Campbell Settlement Road, and is organizing a company to place the water in the market on a large scale for sale for medicinal purposes. The water contains a large amount of sulphurated hydrogen, and is said to possess valuable qualities for the cure of chronic skin diseases, gouty affections, etc. It is a great emulsifier, and will cut about 50 per cent of cod liver oil making it look like milk."

Kings County Record - Oct. 2, 1891 We have been informed that a valuable mineral spring exists on the farm of Mr. Wm. Goddard of Springdale, about 12 miles from Sussex via Penobsquis. The water is a sulphur water and has been tested by Mr. Best, analytical chemist of St. John and found to contain as follows:- Carbonate of soda, 6 grs; carbonate of magnesia, 4 grs; carbonate of lime 1« grs; carbonic acid gas, 1-40 of the volume, and sulphurated hydrogen 1-10 of the volume as freshly taken from the spring. The medicinal effects of this class of water is beyond question valuable and covers a wide range of chronic diseases such as inflammation, rheumatism, skin diseases, etc., being used externally and internally. Mr. Best states that in his opinion the water of the Goddard spring is quite as valuable as the water of any sulphur spring in Europe or America. It is to be hoped that the attention of capitalists will be directed towards this spring, and there exists no good or valid reason why a large and remunerative business could not be done with this spring in the near future. Springdale is a beautiful place in summer and could be made a popular resort for invalids in the summer months. We hope to hear of this matter being taken in hand by capitalists at an early day."

Daily Transcript - Apr. 2, 1892 Havelock Mineral Springs. - A correspondent Writes of a Short Visit to the Factory. - Butternut Ridge, April 2. -[Special] - Your correspondent having occasion to visit the vicinity of the Havelock Minerals Springs last week, dropped into the factory for a few moments and enjoyed a short chat with Mr. W.W. Hascomb, the affable manager of that institution. This Spring is situated one mile below Havelock Corner and some forty rods north of Milltown. For a great many years the late Wm. Keith, Esq., owned the premises and extolled to a great extent the curative powers of this fountain of youth. People only laughed and with a knowing shrug of the shoulders went on with their work, thinking as little of the importance of the mineral water as the people in Noah's time did of the ark. Not till some time after a careful analysis had been made of the water did people get their eyes open to the fact of millions being in it. Outside of the permanent cure of a few skin diseases, nothing has been practically accomplished until now. The late Mr. Keith had a fine two story house, good barns, a commodious stage house and a good farm. The people here not being as keen to take hold of and invest in a business of this character as in Canadian Agricultural Machinery, let the opportunity slip. W.W. Price, F.W. Emerson and a few other monied men from different places formed a syndicate, bought the property and went to work in real earnest. The stage house has been made over and with a little renovating presents the spectacle of business. The late Mr. Keith's residence is now a hotel and during the summer will be found to possess all the requisites of a summer resort; all that energy, pluck and money can make it. Although without the factory presents a modest appearance, hardly betraying the signs of an existence within, as soon as the curious observer crosses the portals a different scene presents itself. Here we find barrels, boxes and bottles filled with four kinds of goods, viz: - Lemonade; Club Soda, Ginger Ale and Aerated Water, and they are putting up from 14 to 16 gross of these bottles per day, and some of the travellers' orders must go unfilled until later. Well we did not visit this place on purpose to test the goods, but we did all the same, and pronounced them 'capital', that is if we are any judge of that sort of beverage. We wanted longer time between drinks, but we were in a hurry and couldn't help it. Here we found the genial Mr. Dodge in charge of that part of the business. In the next apartment Mr. Hascomb, the manager, busily engaged with his ingredients, attending to the finer parts of the work. Mr. Hascomb who has been in this business all his life speaks in no uncertain terms of the prospects of this enterprise. With such water containing more magnesia than any other spring in the world and the company straining brain and cash to its utmost tension to provide necessary appliances and goods, the managers cannot see anything but decided success for the Havelock Mineral Spring Company."

Royal Gazette - Apr. 6, 1892 Notice of Granting of Letters Patent. Public Notice is hereby given, that under The New Brunswick Joint Stock Companies' Letters Patent Act and Amending Acts, Letters Patent have been issued under the Great Seal of the Province of New Brunswick, bearing date the thirty first day of March, A.D. 1892, incorporating John W.Y. Smith, of Dorchester, in the County of Westmorland, in the Province of New Brunswick, Gentleman; Angus McQueen, of Point de Bute, in the aforesaid County and Province, Sheriff; Henry R. Emmerson, of Dorchester, in the aforesaid County and Province, Barrister-at-Law; George H. Trueman, of the City of Saint John, in the Province aforesaid, Railway Conductor; and Edward P. Eastman, of Petitcodiac, in the County of Westmorland, and Province aforesaid, Business Manager; for thepurposes of the manufacturing of Aerated Waters and other similar Temperate Beverages, erecting and conducting an Hotel and Sanitarium in connection with the Havelock Mineral Springs, and the sale of the water of said Springs, by the name of The Havelock Mineral Spring Company, (Limited), with a total capital of One hundred dollars, divided into One thousand shares of one hundred dollars each. Dated at the Office of the Provincial Secretary at Fredericton, the thirty first day of March, A.D. 1892. James Mitchell, Provincial Secretary."

Kings County Record - Apr. 8, 1892 The Havelock Mineral Spring Co. is now in full working order and it is said the product is meeting with a good sale. The natural water charged with carbonic acid gas is said to be equal in every way to the far famed appollinaris water which is such a favorite water with the aristocracy and high livers on both sides of the Atlantic. In such case a big revenue should accrue from its manufacture and sale."

Codes: SPRI / IDX_Names: Mineral Springs;

S.J. Globe - Apr. 11, 1892 Havelock Mineral Springs. - Having had occasion to visit the vicinity of the above place of local importance I stepped in for a few minutes and found business progressing favorably to all concerned. I might here say this place has only recently sprung into importance - to my mind the dawn of its celebrity is just breaking. For several years the late William Keith, Esq., on whose farm the spring was discovered, tried to convince the people of the value of his find, but no one seemed to be moved by his glowing pictures. Beyond the curing of a few skin diseases such as eczema, salt rheum, etc., nothing important transpired to direct the monied men thither. A careful analysis showed there was something in it. And finally F.W. Emmerson, Hon. A. McQueen, W.W. Price and a few more men of means formed a syndicate, organized and purchased the whole farm, dwelling house and barns. The two story dwelling is in charge of Mr. Fred Seely and will contain all the requirements of a modern first class hotel for tourists, health seekers, etc. The stage house has been remodelled and furnished with all the necessary appliances for making ginger ale, club soda, lemonade and aerated water, which contains more magnesia than any other mineral spring in the world. In the first department we find Mr. Dodge, who seems to have charge of the work of that part, and who tells us that so far they are putting up fourteen and sixteen gross bottles of the above goods per day. The most of the work is done in this room under his supervision, but the finest and most essential part of it, we presume, is done in the adjoining room, where is to be found the affable Mr. W.W. Hascombe, manager of the business. Mr. Hascombe informs us that the business is increasing and the orders obtained by their traveller are coming in thick and fast. He also states that everything that money and skill can procure which are necessary to make the business a success, suit customers and patrons, shall be promptly secured. The long experience of the manager in the practical management of the manufacturer of these goods is a sufficient guarantee of the success of the enterprise. Those who have tested these wholesome beverages pronounce them first-class. The syndicate have evidently struck a bonanza. Alpha."

Daily Telegraph - Apr. 21, 1892 Havelock. - A special train is expected in Wednesday, bringing the stockholders of the

Havelock Mineral Spring Co. They will proceed immediately to the hotel at the springs, and after testing the quality of the various drinks manufactured in their factory, and partaking of lunch, will return to Petitcodiac. The factory is turning out about 15 gross of bottles of lemonade, club soda, ginger ale, etc., per day, and even at that rate they cannot supply half the demands made upon them."

Chignecto Post - Aug. 4, 1892 The Havelock Kings Co. N.B. Mineral Springs Co. are running the works to their fullest extent to meet the increasing demand for their superior ginger ale, lemonade, aerated water and mineral water. These goods have met with substantial approval by users of temperance drinks and the outlook for the company is decidedly promising. The greatest drawback is in obtaining bottles. As a specially strong article is required it is found necessary to import them from Germany. Just why some of our local glass makers cannot make them does not appear."

S.J. Daily Sun - Dec. 23, 1892 Hillsboro. - F.W. Emmerson, barrister, of Petitcodiac, was at Albert yesterday. Mr. Emmerson is connected with the Havelock Mineral Springs Company, and reports a large business dine by this company

Royal Gazette - Feb. 2, 1892 Notice is hereby given, that application will be made for Letters Patent, under The New Brunswick Joint Stock Companies' Letters Patent Act, as follows:-1. The proposed corporate name of the Company is The Havelock Mineral Spring Company, (Limited). 2. The object for which incorporation is sought, is the manufacturing of Aerated Waters and other similar Temperate Beverages, erecting and conducting an Hotel and Sanitarium in connection with the Havelock Mineral Springs, and the sale of the waters of said springs. 3. The office or principal place of business is to be in Petitcodiac, in the County of Westmorland, in the Province of New Brunswick. 4.The amount of the capital stock is to be One hundred thousand dollars, divided into one thousand shares of One hundred dollars each. 5. The names, addresses and callings of the applicants are as follows, all of whom are to be the first or Provisional Directors of the Company:- John W.Y. Smith, of Dorchester, in the County of Westmorland, in said Province, Gentleman; A. McQueen, of Point de Bute, in the County of Westmorland, Sheriff of said County. Henry R. Emmerson, of Dorchester aforesaid, Barrister-at-

Evening Gazette - Feb. 24, 1892 The Havelock Mineral Springs Co. are preparing their factory for operation. A quantity of valuable looking machinery has been coming by rail and the work is going forward."

S.J. Globe - Feb. 25, 1892 and Daily Sun - Feb. 26, 1892 and Daily Telegraph - Feb. 26, 1892Havelock Mineral Springs Company. - Messrs. H.R. Emmerson and J.W.Y. Smith of Dorchester, and Sheriff McQueen of Point de Bute, have applied for incorporation as a company to be known as the Havelock Mineral Spring Company, (Limited) with a capital of $100,000 in $100 shares. The office will be at Petitcodiac."

Evening Gazette - Feb. 25, 1892 and S.J. Globe - Feb. 25, 1892 William Keith, late proprietor of the Havelock mineral springs, near Petitcodiac, was found dead in his barn adjoining the spring property Wednesday morning. The indications are that he shot himself with a revolver. When found he was sitting against a hay rack with a bullet wound in his temple. Deceased had no financial or other troubles, but had been suffering for some time from a severe illness and head trouble. He was one of the most prominent men in the locality."

Codes: SPRI / IDX_Names: Mineral Springs;
Kings County Record - Jan. 1, 1892 The stock of the Havelock Mineral Spring Co. is being rapidly sold, and it is expected before long to put up a barrelling house and probably go into bottling it. Mr. F.W. Emmerson of Petitcodiac is disposing of quite a lot of the stock."

Daily Telegraph - Jan. 21, 1892 Havelock. - Last evening several of the prominent men of the Mineral Spring Co. arrived by the E.P. & H. Ry. Among them were H.R. Emmerson and J.W.Y. Smith, of Dorchester; Sheriff McQueen and J.A. McQueen, M.P.P., F.W. Emmerson and J. Eastman, beside several others. Through the courtesy of manager Jones, they were taken by train to the residence of W. Keith on whose farm the springs are located. As a result of their visit some remained to arrange for building and putting in machinery so as to begin operations at as early a date as possible."

Chignecto Post - Mar. 3, 1892 Application will be made at Fredericton for incorporation of the Havelock Mineral Spring Co. with a capital stock of $100,000 of 1000 shares of $100 each. The applicants are: John W.Y. Smith of Dorchester, in thecounty of Westmorland, Gentleman, A. McQueen, of Point de Bute, in county of Westmorland, Sheriff of said county. Henry R. Emerson, of Dorchester aforesaid, Barrister-at-law."

Chignecto Post - Mar. 10, 1892 and Daily Times - Mar. 11, 1892 Havelock Mineral Springs. - This company, composed exclusively of Westmorland capitalists has acquired the mineral spring property at Havelock owned by the late Squire Keith, and will shortly have on the market a full line of goods made from the springs. It is the intention of the company to manufacture and sell in bottles, appollinairis water, mineral water, ginger ale, sarsaparilla, lemonade, aerated water and other temperate drinks. In addition to the natural water of the springs, which possesses remarkable medicinal properties the spring has an output of upwards of 30 barrels per hour and is what is known as a magnesia spring which favorably differentiates it from the sulphur springs abounding in some parts of Nova Scotia. The company will be incorporated with a capital of $100,000. Wm. Hanscom, for 28 years maker of the above beverages in Boston, has been procured to manage

Daily Telegraph - Mar. 14, 1892 Penobsquis Mineral Spring. - Elsewhere in this issue appears the announcement of a remarkable cure wrought by the waters of the Penobsquis mineral spring. The proprietors, Messrs. W. & H. Goddard, report many equally favorable cases. It is understood that capital is being enlisted with a view to develop the property."

Daily Telegraph - Sep. 23, 1892 Havelock. - Mr. Hanscom, manager of the mineral springs, is at present at Washington participating in there union of the Grand Army of the republic, where he will no doubt renew many pleasant associations of friends and eventful scenes of army life."

Evening Gazette - Feb. 10, 1893 and Daily Sun - Feb. 10, 1893Havelock Mineral Springs. - The annual meeting of the Havelock Mineral Spring company was held at Petitcodiac this week, when the following officers were elected: E.P. Eastman, president; Geo. H. Trueman, vice president; J.W.Y. Smith, M.P.P., treasurer; F.W. Emmerson, secretary."

Codes: SPRI / IDX_Names: Mineral Springs;
Kings County Record - Jul. 28, 1893 Havelock Mineral Springs. - A Record Representative Visits There. - Tourists wishing to reach these now famous springs will on leaving the I.C.R. at Petitcodiac, take the train of the Elgin, Petitcodiac and Havelock Railway, and after a journey of about 12 miles reach the terminus of this road in the immediate vicinity of the springs. In the latter part of 1892 Hon. H.R. Emmerson, J.W.Y. Smith, Angus McQueen, George H. Trueman, E.W. Emmerson, F.W. Sumner, J.T. Hawke, Joseph McQueen, W.C. Pitfield, E.P. Eastman, W.W. Hanscom, W.W. Price, W. Keith, and a number of others, organized a joint stock company, and on the 7th of February, 1892, the first regular meeting for the election of directors was held, when E.P. Eastman, F.W. Emmerson, George H. Trueman, Angus McQueen and J.W.Y. Smith were duly elected the first managing board of directors. At a subsequent meeting of the board E.P. Eastman was chosen president; J.W.Y. Smith, treasurer, and F.W. Emmerson, secretary and managing director. The company then purchased from the late William Keith the mineral spring property, consisting of two hundred acres of land, with the springs in the centre of the lot, for which they paid $10,000. The directors then secured the services of William W. Hanscom, a live Yankee, who has had twenty seven years experience in the manufacture of drinks of a similar kind in the United States. Mr. Emmerson, as superintendent of the works began operations on the 17th March, 1892. His first act was the removal of the surface soil in and around the spring, and the erection of a suitable building with pump and pipes by which the sparkling water can be pumped into any vessel placed to receive it. In order that cleanliness can be the better carried out, only glass bottles or demijohns are used to convey the water to the factory, which is about twenty rods away. A stranger on entering the factory will be surprised to find expensive and complicated machinery which is of the latest and most approved pattern, and was made by A.D. Puffer & Sons, of Boston. In the laboratory will be found costly extracts and chemicals. Here is an extract of lemon costing $30 per gallon, and of ginger, $5 per lb., and freed from all traces of alcohol. Other extracts are also used costing somewhat less. A settled purpose throughout has been to use only the very best materials without any regard to costs. In the factory proper, the machine for generating the gas which is infused into all the drinks, consists of five different cylinders connected by valves. Into one of these is poured a quantity of sulphuric acid mixed with chalk. This mixture is carried to the next cylinder by the moving of a valve and the revolving of the internal machinery. In another cylinder a certain quantity of water is placed, so as to form a percolator. Through this water the gas is purified in passing. It is here in its reduced and purified state, injected into other cylinders, which contain pure water from the mineral spring. In order to give the reader a clearer idea of how the strength of the gas formed in the cylinders is regulated, it may be remarked that on the cylinders are placed gauges. On these, the expansive force of the gas generated within, acts exactly similar to steam pressure, and as a matter of course, these gauges guide the operators so that every bottle of drink turned out of the establishment will be of uniform strength. In front of the cylinders is a table, in the centre of which the apparatus for bottling is placed, and to which the gas from the cylinder is conveyed by a small pipe. It will now be in order to explain how the drink proper is prepared. In the laboratory is a large boiler filled with spring water. This is heated to the boiling point, and into it is put the different extracts required for the different kind of drink, which includes in the make-up, a quantity of granulated sugar. After the whole has been properly dissolved, the liquid is taken from the boiler and very carefully strained, after which it is put in a vessel located on the second floor immediately over the bottling table. In this vessel is a small pipe which conveys the syrup to a point of junction with the gas from the cylinders. The bottler then takes up his position at the table, and by levers used by hand and foot, the gas and syrup are simultaneously forced into the bottle which is placed in an upright position by an active movement of the bottler. As soon as the bottle is filled, the cork, which had been placed above the bottle in a slot, is instantly forced into the neck of the bottle by a lever under the control of the man at the table. At each of the opposite ends of the table stands a man with a pair of tongs, by which the bottle is speedily taken from its first position (the tongs the meanwhile holding the cork in), and placed under a machine which holds the cork tightly pressed down until the wire is looped over the cork and fastened. The tier then puts the bottle into a portable box having twenty-five compartments. These boxes are quickly filled, as the bottler fills and corks four bottles per minute. The movements all round have to be executed with the utmost speed. From the tiers the filled boxes are taken to the table of the young man who puts a label on each bottle, after which the box is again filled and carried to the place where the bottles are packed in inverted position in crates, holding 25, 30 or 72 bottles each. The crates used for shipping these goods are made by Messrs. Flewelling & Co., of Hampton, and are in every respect suited to the purpose intended. It will be a long time before any improvements are made on the crates. The different kinds

of drinks manufactured by Mr. Hanscom are lemonade, ginger ale, club soda and natural water aerated. The company expect that their sales will reach $40,000 the present year. The superintendent informed us that so great was the demand for their goods that they were unable to fill all orders promptly. The company have imported 2,000 gross of bottles since they began operations. These bottles cost about four dollars per gross, duty paid. About $3000 have already been paid for bottle cork, which are never on any account used the second time. The bottles have to be returned to the company by the purchaser of the goods, the freight on which the company pay. These bottles, when taken into the factory, are put in a large tank where they are washed in hot water; all corks, wires and labels removed, after which the bottles are put into another tank, where they are rinsed in cold water, then placed in racks in an inverted position so that they can dry properly, after which they are again fit for use. There are twelve hands employed in and about the factory, every one of whom has his own work to attend to, which he executes with correctness and alacrity. There is no confusion or unnecessary noise but the most perfect discipline is maintained throughout. The average output is eighteen gross per day. Perhaps many of our readers are not aware that there are two springs on the company's property within twenty feet of each other, one of which, not now used, is a sulphur spring, the overflow of which is 540 gallons per hour. The other, the larger one, is that from which all the drinks are made. The chemical analysis of the water of this spring is as follows in one imperial gallon: Grains Magnesium carbonate .... 84.64 Sodium chloride .... 35.15 Calcium carbonate ...... 19.80 Sodium bicarbonate ..... 12.44 Potassium sulphate ..... 8.27 Calcium sulphate .... 1.46 ------ 161.76 There are also traces of iron, iodine and silica. The overflow of this latter spring is 1500 gallons per hour. We understand the company intend to erect bath houses, and utilize the sulphur spring for hot and cold baths. There is also a fine opportunity to form an artificial lake from the large overflow of water from these springs - over 2000 gallons per hour. A level, cleared field just below the springs could be easily transformed into a beautiful lake. Without doubt we shall see the lake with boats and boat houses in the immediate future. On the elevated land to the westward of the springs is a most beautiful space for a large hotel, and the company would do well to look after this matter. The present spring hotel is a comfortable and well kept house but too small to accomodate those who would flock to the springs in case the improvements we have outlined should be made. We have been informed by several parties, who sell the Havelock waters, that these drinks are fast superceding all similar goods made elsewhere. Mr. Hanscom is ably assisted by his son in the manufacture of these unique drinks, and it could be safely predicted that a sweeping success is in store for the sale of the goods manufactured at the Havelock Mineral Spring, under the eye of one

Jun. 1893 - Copied from: St. Croix Courier - Jun. 11, 1953 60 Years Ago. - E.H. Barter is bottling the water of St. Stephen mineral spring, which for many years past has been known to possess valuable medicinal qualities."

S.J. Daily Sun - Nov. 17, 1893 La Tour Mineral Springs. - These springs, situated on a high, gravelly ridge near the mouth of the Jemseg, pour forth a palatable medicine of nature's ownpreparing that is rapidly acquiring reputation as a curative of many of the ills to which flesh is heir. S.R. Huestis, the proprietor, has such confidence in the springs that he sends samples of the waters free to all applicants. A large hotel and sanitarium at the springs is Mr. H.'s latest proposition."

Kings County Record - Aug. 3, 1894 W.W. Hanscom, manager of the Havelock Mineral Springs Co., was on Monday, the occasion of his 56th birthday, presented by the employees of the springs with an appropriate address and a beautiful black ebony gold- headed cane. The cane has this inscription engraved upon it: Wm. W. Hanscom, Havelock, N.B., July 30th,

Daily Times - Feb. 8, 1894 Havelock Mineral Springs Co. - The annual meeting of the Havelock Mineral Spring Co., was held in the company's offices at Petitcodiac on Tuesday morning. The annual report of the secretary and manager, Mr. F.W. Emmerson, was read and received. It showed an expansion in the company's operations, a large increase in the plant acquired for effective work and also for next season. The auditors, Hon. T.R. Jones and Mr. George W. Fowler, in their annual report, paid a tribute to the accuracy with which the secretary-manager had kept the books and vouchers, and in conclusion recommended a dividend of five per cent on the original stock. Verbally the auditors also made suggestions as to a line of business policy for the future. The board of directors are as follows: E.P. Eastman, Geo. H. Trueman, George W. Fowler, C.B. Keith and Edmund Simpson. The new board of directors elected the following officers: Geo. W. Fowler, president; Geo. H. Trueman, treasurer, and F.W. Emmerson, secretary. Some important changes in the mode of management and the location of the general offices at the Springs are contemplated."

Daily Sun - Feb. 9, 1894 The annual meeting of the Havelock Mineral Spring company, Ltd., was held at the head office in Petitcodiac on Tuesday last. The following officers were elected Geo. W. Fowler, president; Geo. H. Trueman, treasurer; E.P. Eastman, Petitcodiac, secretary; Edward Simpson, Petitcodiac and C.B. Keith of Havelock, directors. Confidence is felt that with the new board the business of the company will be carefully and prudently managed, and a much larger dividend will be paid the stockholders next year."

Kings County Record - Jun. 8, 1894 The Havelock Mineral Springs Company are entering upon what promises to be a greatly enlarged output of their popular drinks. The sales heretofore have not extended beyond the Maritime Provinces but now the prospects are exceedingly bright for an extensive business being done in Ontario and Quebec. When the valuable medicinal qualities of these springs are taken into account along with unsurpassed drinks made from such, it is not unreasonable to expect a boom. The present board of management seems to be putting forth wisely directed efforts to make a success of them and we hope their expectations will be fully realized."

Daily Times - Nov. 23, 1894 The Havelock Mineral Springs company will close the manufacture of their popular drinks for the season about the 10th of December. We are informed that the past season has been a good one for the company."

Progress - Feb. 2, 1895 Three thousand weight of mineral-spring water constituted one day's shipment from Waterford recently for St. John and different places in Nova Scotia."

Chignecto Post - Feb. 27, 1896 The directors of the Havelock Mineral Spring Company met at the Victoria last night and considered an offer from J.C. Mahon of Truro for the purchase of their property and business. The offer was, it is understood, as good as accepted. Geo. W. Fowler, M.P.P., the president, will be communicated with this morning and on the receipt of his decision (which is said to be favorable to the sale,) the transaction will be made. If he gets the property Mr. Mahon will put up new buildings at the springs, with the steam power required for the conduct of a much more extensive business than has hitherto been carried on."

S.J. Daily Sun - May 13, 1896 The Sussex Mineral Spring. - A Reporter's Visit to This Now Famous Spa. - On the upper waters of the Kennebecasis, nestled among the famously picturesque Kings county hills, lies the pretty and thriving village of Sussex Vale. Sussex Vale so called by the post office authorities was the name in olden time, but the latter part of this combination has long since been dropped and plain Sussex is now the familiar apellation. Nature has bestowed lavishly her gifts on this portion of our fair province. The beautiful stretches of fertility which greet the eye from the surrounding hills form a landscape of scenic grandeur interspersed with peace and plenty seldom equalled. Here some of the most productive and best managed farms in New Brunswick yield to the toiler abundant reward for his labor. But the special mission of the reporter was to investigate one of nature's most remarkable contributions - the water of the Sussex Artesian Mineral Spring. For centuries Mother Nature kept this secret locked deep down beneath the soil until the drill of the enterprising borer penetrated hundreds of feet of rock and set free this subterranean wealth. This occurred a couple of years ago, but still the steady upward flow comes with the same unvarying force - a pressure sufficient to raise the water 25 feet above the ground. Five streams in all flow unceasingly. A sample was sent the geological survey department at Ottawa for analysis, and the very favorable report received certified it to be an alkaline water containing chloride of potassium, chloride of sodium, sulphate of soda, carbonate of soda, ferrous oxide, magnesia, lime, silica and chlorine. The report comments very favourably on its qualities as a dietetic table water which may be drank ad libitum. It is highly recommended as a remedy for rheumatism, nervous afflictions and dyspepsia. Its very low temperature (42 degrees), its absolute freedom from contamination with surface impurities, its peculiar healthful properties, makes it an ideal water for carbonating (sometimes called aerating) purposes. Last September a company was formed with the idea of putting this now celebrated water on the market. A set of the most modern bottling machinery with accompanying appliances was purchased and the services of an experienced bottler secured. The company was most fortunate in securing the services of Mr. B.L. Cushing, who had personal charge for ten years of the Seal Rock spring, supplying many of the leading hotels and summer resorts of New England. Mr. Cushing is a careful painstaking operator, and understands every detail of the business. Besides the water, which is supplied in its natural state in barrels and charged with pure carbonic acid gas in pint bottles and splits, some sixteen flavored beverages are put up, each one being prepared with great care from special formulas. Especial mention might be made of Manola, a tonic beverage and appetizer of great sustaining and stimulating properties. Then follow Ginger Ale, Birch Champagne, Pepsin Soda, Celery and Iron, and a number of other new and special flavors, all of course strictly non-alcoholic. Particular attention is given to purity and cleanliness. Before filling, each and every bottle is washed in four separate waters and thoroughly secured with steel shot by a cleverly contrived machine lately patented. The label design adopted - a red Grecian Cross - makes this brand easily distinguishable, and before many months the company hopes to make it famous in at least the eastern portion of Her Majesty's North American domain."

S.J. Daily Sun - Jun. 29, 1897 Sussex. - Dr. L.W. Bailey of Fredericton was in Sussex today on business for the dominion government. He tested the Sussex Mineral Spring Co.'s works while here."

Daily Times - May 23, 1898 Havelock Mineral Springs. - Mr. J.C. Mahon, of the Havelock mineral springs, who was in the city Saturday reports business brisk in his line. They have been so rushed at the factory that some of their spring orders have not yet been filled."

Daily Times - Nov. 26, 1898 Havelock Mineral Waters. - Mr. J.C. Mahon, manager of the Havelock Mineral Springs, went to Boston yesterday on a business trip. Mr. Mahon informs the Times that the Havelock Mineral Springs Company has had a very successful season the past summer. In fact this popular aerated water has had a larger sale in the provinces this year than ever before. Next season an effort will be made to increase the sale of this product in the American market, where it is growing in favor and has gained considerable ground in competition with similar tonics."

Daily Times - Aug. 28, 1899 Havelock Mineral Springs. - The Havelock Mineral Springs Company recently made a large shipment of their ginger ale to California."

Kings County Record - Feb. 14, 1902 Owing to the unusually large numbers of orders being received the Sussex Mineral Spring Co. started bottling the first of the present week in order to get sufficient goods ahead to fill the many orders now in awaiting spring delivery."

Kings County Record - Feb. 25, 1902 We have been requested to make mention of the well known sulphur spring on the farm of Mr. Wm. Goddard, of Springdale, about twelve miles from Sussex. This spring has been analyzed by Mr. Best, analyst, and contains many marked medicinal characteristics particulars of which were once published in the Record some time ago. Being situated in a very nice location it would seem as if capitalists might find here a good field for investment, as the water is claimed to be the equal of any sulphur spring in existence. All information can be had of same by corresponding with Mr. Goddard, at Springdale."

Weekly Record - Fri., Feb. 27, 1903 Mr. J.P. Bradley, late clerk of the Depot House is now on he road travelling for the Havelock Mineral Spring Co., and will no doubt do a good business for the firm."

Codes: SPRI / IDX_Names: Mineral Springs;

Weekly Record - Fri., Jul. 3, 1903 Messrs. Raymond & Doherty, proprietors of the Royal Hotel, are considering the establishment of a hotel and baths at the mineral springs near Upham. This will follow on the starting of operations by the Mah Pa Mineral Springs Company, which is made up of St. John men. Members of the company will go to Upham to day in connection with the building plans for the work at the springs. - Telegraph."

Kings County Record - Nov. 6, 1903 The Mah-Pu Mineral Spring Co., of Upham are getting ready for business. They are about to let the contract for the erection of a large bottling plant."

Kings County Record - Nov. 13, 1903 The developments of the Mah-Pu mineral springs at Upham give promise of considerable importance. An hotel of twenty five rooms and a bottling plant 41x82 feet will be erected, the whole to be ready for occupancy on May 1st next. The estimated cost of these building is $24,000. The capital stock of the company is $75,000. The hotel will be in charge of Raymond & Doherty, of the Royal Hotel, St. John."

St. Andrews Beacon - Sep. 10, 1903 The seven acre lot containing the Algonquin mineral spring has lately been purchased from the Claffin estate by Mr. F.H. Grimmer."

Kings County Record - Feb. 3, 1905 Mineral Spring Discovered. - It is understood that a rich mineral spring has been discovered on the farm of Wm. Goddard, at Springdale, Kings County, three miles from Penobsquis Station. A small sanitarium is now being erected and it will be able to accommodate fifteen patients next summer. It will be in charge of a McGill medical man. The water is sulphur water and has been tested by Mr. Best, analytical chemist of St. John, and the result is as follows:- Carbonate of Soda, 6 grs.; Carbonate of Magnesia, 4 grs.; Carbonate of lime, 1 1/2 grs.; Carbonate Acid Gas 1.40 of the volume and sulphurated hydrogen 1.10 of the volume as freshly taken from the spring. The medicinal effects of this kind of water is beyond question. It is very valuable in cases of rheumatism and kidney disease. Mr. Best states, that in his opinion the water of the Goddard Spring is quite as valuable as the water of any sulphur spring in Europe or America. It is to be hoped that the attention of capitalists will be directed towards it this spring, and there is no good reason why a large and remunerative business could not be done with the water from this spring. Springdale is a beautiful place in summer and could be made a popular resort for invalids during the summer months. Moncton Transcript."

St. Croix Courier - Oct. 11, 1906Ancient Discovery. - Writing in the St. John Globe of events in 1833 Clarence Ward says: It was considered in old times that the more nauseous and evil smelling the medicine was the more efficacious was its action. The paper of Sept. 7 describes the discovery of a wonderful mineral spring in the parish of St. David, Charlotte county. which was considered to possess 'strong' medicinal qualities, on of which was the 'loud' smell: 'Mineral Spring - We learn from a communication in the St. Stephen Times that there has recently been discovered in the parish of St. David, about a mile from the Ledge, in St. Stephen, a mineral spring, the waters of which are considered as possessing stronger medicinal qualities than those of the celebrated Wilmot springs in Nova Scotia. The waters have not yet undergone a chemical analysis, but there can be no doubt (and such is the opinion of medical men) that they will be found efficacious in many diseases. The waters are saline and offensive to the smell (!), discharging a soft white substance, resembling curdled milk. The springs are situated about four miles from the villages of St. Stephen and Calais."

Kings County Record - Jun. 2, 1955 Gusher Well Dug on Sussex Lot Starts Widely-Known Beverage Firm. - ...... This year witnesses the 70th anniversary of what is now the widely-known firm, Sussex Ginger Ale, Ltd. .... Simeon H. White, prominent New Brunswick industrialist of another generation, certainly started something when he had a well drilled on the grounds of his big home in Sussex in the early 1880's. He merely wanted a good well for his own household. But the water gushed skyward to the height of 50 feet and was brought under control only with considerable difficulty. ...... On his property Mr. White had an empty building. In this he set up a small and primitive bottling plant. ..... long article......"

S.J. Daily Sun - Sep. 25, 1888 Our Mineral Products. - According to the valuable report of Eugene Coste of the geological survey ... From the Grand Lake coal field fifteen returns received by Mr. Coste represent a sale of 8,360 tons. He believes the total output to have been about 10,000 tons. ..... The mineral products of New Brunswick are by no means unimportant. Mr. Coste could not get full returns and therefore his figures, made up from the reports received, are below the mark. Following are the mineral products from this province of which he has obtained information: Quantity Value Grindstones ... 3,582 tons $38,988 Arsenic ... 100 pounds 4 Coal ... 10,040 tons 23,606 Copper ... 2 tons 200 Graphite ... 300 tons 2,400 Gypsum, crude ... 29,102 tons 29,266 Manganese ... 939 1/2 tons 21,260 Granite ... 6,289 15,125 Building stone 8 returns) ... 6,871 cubic yds. 52,901 Lime ... 478,410 103,463 Brick, thousand ... 6,476 43,454 _______ Total value ... $330,667 The above statement gives $15,125 as the value of granite. The value of the product as it comes from the quarries is small compared with that of the finished product, but it must be much greater than this report indicates. New Brunswick sent to the Western provinces at least $100,000 worth of polished granite last year, and our exports to the United States are large. Mr. Coste's returns of the plaster business do not give the value of plaster of paris exported from the Hillsboro works. The possibilities of mineral production in New Brunswick are great. Our immense coal fields will in a few months be made accessible. The supply of grindstone and building stone in Gloucester, Westmorland and Albert counties is practically unlimited. The same may be said of the supply of merchantable granite on which a great part of at least one parish in Charlotte County rests, to say nothing of the quarries up the St. John river. The plaster mountains of Hillsboro extend for miles, and no limit has been found to the deposit on the Tobique. The output of manganese in Kings County is only limited by the demand. The supply of plaster at the mouth of the St. John is practically inexhaustible. There is no reason why the output of New Brunswick mines should not double in value within the next three years."

Kings County Record - Feb. 5, 1948 Production Value of Mines Increases. - The value of production from New Brunswick's mines in 1947 was appreciably higher than the previous year, it is learned from Hon. R.J. Gill, provincial minister of lands and mines. Total valuation of all minerals which includes coal, oil, natural gas, gypsum, stone, clay products and peat moss amounted to approximately $5,000,000 in 1947, the minister said. The Hillsboro production of gypsum - 81,000 tons - was the greatest annual tonnage yet achieved. Coal, New Brunswick's most important mineral, yielded 326,590 tons and was valued at $2,135,894. While tonnage yield was slightly less, its value was up over 1946. A production loss of 100,000 tons is estimated as the result of a strike in the Minto-Chipman coal fields early in the year. Average number of men employed in the coal mines last year was 860. One fatal accident occurred in 1947. The production of non-metallics, clay productsand other structural or industrial materials was up slightly over 1946 and their valuation showed a considerable upturn. Production records for 1947 were as follows: gypsum, 81,000 tons valued at $484,380; natural gas, 506,466,000cubic feet valued at $243,100; petroleum (crude), 24,878 barrels valued at $34,829; limestone (quick and hydrated lime) 122,273 tons valued at $442,045; stone, 66,920 tons valued at $134,106; peat moss, 2,730 tons valued at $97,065. Sand and gravel pits yielded 2,546,960 tons during the year and were valued at $942,165. Of special interest last year was the fact that for the first time in 20 years bog manganese was exploited. A total of approximately 1,000 tons was mined. During the year there were 127 shaft and 72 strip inspections and one fatality investigation. Production of clay products, said the minister, exceeded that of any previous year. The department now maintains equipment for laboratory determinations of carbon dioxide, carbon monoxide, methane, oxygen and for it determinations of carbon monoxide and methane. Apparatus for resuscitation of persons suffering asphyxia and apparatus for entering gas-contaminated or oxygen- deficient atmosphere is maintained in the coal fields. Three diamond drills now operate in the province. The new one introduced in 1947 is equipped with hydraulic feed."

S.J. Daily Telegraph - Nov. 10, 1979 S.J. exports to Oct. 31.: 1878 1879 Products of the mine ... $ 50 1823"

Codes: X1 / GEOL / IDX_Names: Grand Lake Coal; Geology - General;
N.B. Courier - Nov. 4, 1837 LETTER VI. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor andCommander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: In my last letter I endeavored to give a general review of the different formations of New Brunswick, with their probable extent, and boundaries, so far as the information received from different sources, and my own investigations would permit. An attempt has also been made to describe the limits of the great coal districts of the Province, and to shew the relation it bears to the carboniferous deposit of Nova Scotia. But so little is known of the geology of the country that it would be impossible at present to give an accurate delineation even of its most prominent features. It therefore remains for me to lay before Your Excellency such remarks as were made, during the survey of the Coal Mines, and also the observations recorded on an excursion from St. John to Richibucto, by way of the Grand Lake, and Salmon River. About three miles from Gagetown, the channel of the St. John is divided by a large tract of alluvium called Gidney's Island. From this place a narrow and deep opening, three and a half miles long, called the Jemseg, communicates with the Grand Lake, giving vent to its surplus waters. Passing along this singular channel (at many places not more than ten rods wide) in a steam boat seems like paddling through a grove of elms, and the smoke from the chimney forms a sable curtain among the tops of the trees bending over the watery path. Even cows and horses here are fond of aquatic excursions, and are often seen swimming from bank to bank of the stream; I could not however, discover that they were more web footed than those living in more terrestrial situations. It was the opinion of Lamark that species of animals as they change their situation, and manner of living, so they change ""little by little the consistence and proportion of their parts."" Were this doctrine correct, it might be supposed that all the quadrupeds on the shores of the St. John and Jemseg, would have feet like ducks, which are well adapted for swimming and walking over soft mud. The Grand Lake is about twenty five miles long and will average four miles in breadth. It is navigable throughout, and communicates with French and Maquapit Lakes, by small channels running parallel to the St. John. A considerable ""bar"" is formed where the Jemseg enters, and a schooner was observed stranded near its extremity. This is the only obstacle between the sea and Salmon River, and a moderate sum could scarcely be applied more advantageously for the inhabitants of this flourishing part of the country, than by opening a deeper passage to the Lake. About three miles from the entrance of the Jemseg, and not far from a church on its east

side, there is a considerable cliff of new red sandstone, and conglomerate; rocks which extend a number of miles along the shore. These formations were also observed at Long Point, and the borders of the lake on its western side, where they sometimes form perpendicular cliffs fifty feet high. The new red sandstone rests directly on the coal measures, and evidently belongs to the formation seen at Pleasant Valley, and other places on a line running east and west through the Province. Occupying a broad belt on the surface, its constant disintegration and marly composition, afford a large and most fertile tract of country. I was rather surprised to find a species of wild grape growing on Goat Island, a small isolated collection of sand about four miles northward of Long Point. They are reported to be more common on the islands in the Oromocto, and main river. These grapes would be much improved by cultivation, and being indigenous are fitted to endure the long winters of the climate. Three species of mussels were procured on the adjacent shore, one of them is peculiar on account of the large size of the hinge, and its pearly lustre when polished. I will now refer to that portion of the Province where coal has not only been discovered, but also worked on a limited scale for several years, and quote some general remarks contained in my report to the Salmon River Coal Company, after I had examined the situation and probable extent of the deposit where they are now expending their capital. At the northern extremity of the Grand lake, andwhere the Salmon River and Long Creek, discharge into that beautiful sheet of water, an outcropping of coal was discovered a few years ago, and in a situation favorable for its mining and transportation; for the river and creek here are sufficiently deep to admit vessels of two hundred tons burthen. This vein of coal is only twenty two inches thick, and the accompanying strata are nearly horizontal. The small inclination they seem to have in a northerly direction may be only a gentle waving in the layers, and not a permanent dip in that direction, as the stratum of coal was observed at almost an equal distance above the level of the lake, wherever it was seen, and several miles from the site of the company's operations. A number of small shafts and levels have been opened into this layer at the mouth of the Salmon River, but notwithstanding the favorable situation thus offered, the work appears to have been injudiciously conducted heretofore, and it has yielded no profit to those who had promised themselves every success. It is now however going forward in a proper manner, under the direction of M.H. Perley, Esq., the Agent, and Captain Cunningham, who superintends the business constantly. The operations now consist in raising coal from the thin seam, and3 boring for a deeper and richer deposit; and although the latter speculation must necessarily be attended with considerable expense, there can be little doubt of ultimate compensation if those engaged in it do not become discouraged too early in the enterprise. At the distance of a mile and a half northward of the shaft at a place called ""Crawford's farm,"" several small openings have also been made, and coal was raised from the stratum just mentioned. This situation is equally advantageous for mining operations, and lying on the bank of the river, vessels might receive their cargoes at the mouths of the pits. Besides the advantages these places possess in regard to their position in the coal field, which is here uncovered by the more recent formations of sandstone and conglomerate - the surface is overlaid with beds of plastic clay that will effectually prevent the water from descending into the mines beneath, an object of much importance to the miner. In the neighborhood of these mines I discovered a quantity of the argillaceous oxide of iron. From this kind of ore almost all the iron in Great Britain is manufactured, and it is highly probable that a sufficient quantity may be procured near the Salmon River, to supply a smelting furnace on the very spot where the coal for fuel is taken from the earth. The stratum of coal already referred to, appears at Barton's Point, Newcastle Creek, and Coal Creek. In the distance of six miles on the latter stream, twenty levels have been run into the south bank, and a considerable quantity of coal has been removed. Three mines are now in a dilapidated state, and probably never exhibited any great degree of skill in the subterranean art. At Brown's Mill, six miles from the mouth of Coal Creek, it was curious to observe a number of chaldrons of coal on the mill dam, while the stratum may be seen running along its north side. Coal has also been raised at other places bordering on the creek and northern extremity of the lake, but during an excursion over a large area in this part of the Province, it was found of uniform thickness, and under such circumstances as shew that only one stratum in the basin has ever been opened. Some of the sandstones contain large quantities of the decomposing sulphuret of iron, (Fer sulfure epigene of the French) and are admirably adapted for the manufacture of copperas. The sulphur by absorbing oxygen from the air forms sulphuric acid, which by combination with the iron produces sulphate of iron. Several large specimens brought away became covered in a few days with the efflorensence of the sulphate nearly pure, and I was obliged to immerse them in a solution of gum arabic to prevent their decomposition. When the uniform thickness of the coal, the regularity in the distance at which it appears above the waters of the lake and rivers, with the apparent absence of faults, are considered, and various other 4 circumstances connected with its quality, and the rocks embracing it, there can be no doubt that one and only the most superficial stratum has been penetrated. Nor can any who are acquainted with coal fields hesitate to believe that there are other and richer layers placed beneath it, but at a distance impossible to calculate, in consequence of the horizontal position of each stratum in the basin, and the difficulty in discovering the outcroppings of the underlying rocks. In examining three measures of the great coal district of Nova Scotia, and New Brunswick, it will be found that they each contain a number of coal strata. At Sydney they are numerous. In the eastern coal field of Cape Breton, there are no fewer than fourteen veins of good coal, and none of them is under three feet in thickness. At Pictou, the main coal band is no less than thirty six feet thick, with many other layers from a foot to two yards in depth. At Tatamagouche, the [??] veins have been opened. At Maccan three, at the Joggins on Chignecto Bay, nineteen appear of different dimensions; therefore reasoning by analogy and a comparison of the basins belonging to the same vast district, it can hardly be supposed, that there is only a solitary stratum at the Grand Lake, but on the other hand it must be believed that there are a number of deposits of the bituminous mineral, some of which are probably of great thickness. At Salmon River, the coal already discovered is only eighteen feet below the surface, and it is impossible that it can be the lowest in the series, or the carboniferous limestone, and mill stone grit would be at hand, and there are no valleys of denudation or marks of other geological catastrophes, which indicate that the upper strata of coal have ever been removed. It is to discover a deeper and better deposit of coal that the Salmon River Company are now engaged, and they have chosen a favorable situation to commence boring. The result of this enterprise will be of the highest importance to the Province. Should they be successful, a new source of wealth, and the greatest public benefit will be the result. There a number of steamboats employed on the river and running along the coast, almost all the fuel consumed by them is imported from England, and as steam navigation and manufactories increase, so will the demands for coal be multiplied; and therefore it is obvious that the opening of a bed of that valuable substance or any other mineral would at once elevate the condition of the country, and give the Province a rank even higher than that of other British Colonies. The bituminous shale overlying the coal at Salmon River, abounds in the remains of plants that flourished upon the earth at a former period, and when its condition was widely different from any that has followed since. These fossil vegetables have not all been converted into coal; many of them are but partially carbonized, and 5 others have their original cortical covering completely filled up with the slate clay, in which they have been imbedded. But all clearly point out the character of the vegetation and the climate, which preceded that era when other races of plants and animals were to be supported on the earth. Equesetums are much less numerous here than in the coal mines of Nova Scotia, while ferns and other criff togamous plants seem to be more numerous. One kind was observed resembling the Club Moss of South America. There are several others difficult to class with living genera, and two varieties of leaves with their stalks resembling some of the grasses were taken from the floor of the mine. Many of these fossil vegetables are admirably preserved and the impression of almost every fibre can be distinctly traced on the shale where they have stamped. It is difficult to prevent these specimens from falling to pieces as the soft rock containing them crumbles down into a tenacious clay when exposed to the air, and therefore require a thick coat of gum. It is evident from an examination of the fossil flora of the coal period, that the plants then laid up to supply mankind with fuel, were scattered to distinct groups over the country where they lived, each enjoying a situation most favorable to its growth, as the plants now thrive, each in its own favorite soil. In one coal basin one species of petrification is abundant, in another a different class exists, and sometimes the coal has been derived from a single kind only. I am now endeavoring to ascertain, if possible, what classes and species have produced the best coal, and whether the quality of the fuel does not depend on other

New Brunswicker - Feb. 22, 1842 Fourth Report on the Geological Survey of the Province of New Brunswick. - In the second part of the Report, Doctor Gesner enters into a description of the great Coal Field of New Brunswick. This Coal Field, says the Dr. occupies the whole of the counties of Kent and Sunbury, the chief part of Queen's, York and Northumberland, and a portion of Westmorland, and embraces an area of seven thousand five hundred square miles! If the Westmorland Coal Field also belongs to this carboniferous deposit, the whole area may be computed at eight thousand seven hundred square miles !!! Should thisopinion hereafter prove correct, New Brunswick will possess the most extensive coal mines in the world. We extract the following remarks on the geographical position of the coal field:- (For extract see original report ...) We take leave of this Report on the natural resources of our Province with feelings of satisfaction, and recommend it to the notice of all our readers, as containing much useful information."

Codes: X1 / GEOL / IDX_Names: Grand Lake Coal; Geology - General;
S.J. Globe - Jan. 14, 1867 Natural History Society. - Mr. R. Matthew read ... On the northwestern side, a long strip of land, called Grand Point, stretches out a mile into the lake, and the extreme part of the bar beyond this point, which is nearly another mile out, terminates in quicksands. Numerous large fossil trees are found in the conglomerate rock on the southern side of this point; and from their position and character it is evident that they were drifted together before they fossilized. All the woody fibre in them is carbonized, and iron pyrites is present in large proportion. Their vegetable character is very apparent and distinct in these fossils, and sections of them, when polished are very beautiful and interesting objects for study. In this neighborhood, too, is found agranular oxide of iron, known as Hematite; but whether its quality would render it valuable for smelting is a point which has never yet been determined. On this side of Grand Lake the Newcastle River empties into it, and most of the Coal called Grand Lake Coal comes from the mines adjacent. The mines are two or three miles from the shore; and produce annually about 4000 chaldrons. If properly worked, they might be made to yield 40,000 chaldrons. The principal seam worked here is about 20 inches in thickness. A great saving in the expense of shipping these coals (which is now heavy) might be effected by the construction of a horse railroad to convey them to the vessels. The cost of mining is $1.50 per chaldron; that of transportation might be brought down to $1.25, - so that the coals could be sold in St. John at $3.00 per chaldron. The blue clay which here lies above the coal contains many fossil plants, conspicuous among them being the ferns, of which there are more than 20 species. Probably no other place on the continent affords more abundant or better specimens of the carboniferous ferns. The land at the head of the lake is divided into what are called the North and the Northeast Arms. The Salmon River which flows down through the North Arm runs from far back in the County of Kent, its headquarters being divided from those of the Richibucto by a very few miles. The mines on the Salmon River have a seam of coal 19 inches thick, and of good quality. They are well situated for working. The cost of bringing down the coals for shipment is 75 cents per chaldron. Although the natural beauty of the place is destroyed by these mining operations, that is a result which the necessities of man and the steam engine everywhere produce. The mines of the Coal Creek Company are situated on the banks of the large creek or stream which runs down the side of the Northeast Arm, having nearly the same direction as the course of Salmon River. The seam at present worked by this Company is 17 inches thick and the mines are most favorably situated. A bridge built by the Government to carry a public highway 3 across the stream alone prevents the ready and cheap shipment of the coals. If this bridge were converted into a draw bridge, schooners could easily go up and load directly at the mines thus saving

much expense and the deterioration which frequent handling of the coals inevitably causes. When the alteration in the bridge is made, as it probably soon will be, the Coal Creek Company will be enabled to avail itself of its very advantageous position. The Coal got at the Grand Lake is highly bituminous; and it possesses other excellent qualities. Its value for the purposes of the blacksmiths has been long known and appreciated; and it is now beginning to find its way as one of the best kinds we have, when properly screened, in domestic use. It has also been found to be extremely valuable for consumption in the furnaces of steam boilers; its tendency to coke upon the bars being the only drawback. This difficulty, however, will, it is thought, be entirely obviated by the construction of a newly devised furnace. Whether there are other good workable seams below those now mined at Grand Lake is an unsettled question. Dr. Gesner, who first made a geological study of this district, and examined the results of borings made by the Salmon River Company, in the course of which eight feet of shale and coal were said to have been passed through at a depth of 210 feet, was quite confident of the existence of good lower seams. But Dr. Robb, who was a more accurate and cautious observer, had great doubt upon this point and inclined to the opposite opinion. No thorough survey of the district, however, has been yet made. Professor Hind only traversed the outer rim of the Coal Basin. Prof. Bailey has not hitherto had an opportunity to examine this portion of the Province at all. Mr. Matthews then gave a brief statement of the reasons why thicker seams might be expected to occur below those now reached. These reasons are principally derived from a reference to the coal seams in Nova Scotia. Dr. Dawson's opinion in favor of the probability of the existence of other productive seams is based upon a careful examination and comparison of the fossil plants here found; and his deductions show the immense importance of scientific observations, and the practical value of these delicate fossil ferns. Last year the Coal Creek Company commenced borings upon their property to ascertain the position of lower seams; but the breaking of the apparatus before they had gained any great depth put a stop to their proceedings. They intend to prosecute the work afresh next summer. Mr. Matthew closed his paper by a brief description of the extent and situation of our coal field. The coal measures occupy a basin in the middle of the Province, and extend over about one fourth of its surface. These coal fields have been as yet very imperfectly surveyed, and our knowledge of them is consequently very incomplete. In his opinion, it is quite probable that good productive seams may be discovered in the country at the upper parts of the Salmon and the Richibucto rivers. Mr. Matthew illustrated his observations by frequent references to a geological map; and at the close of his remarks formally received the thanks of the Society for his valuable contributions to their papers."

Kings County Record - Mar. 11, 1927 A geological map of the Minto coal field of New Brunswick has been published by the Geological Survey. Itconsists of two sheets on a scale of one mile to one inch. The coal bearing formation, earlier sedimentary formations, and a basaltic extrusive rock are indicated in colors. The topography or the elevation of the land surface above sea-level is shown by contour lines with an interval of fifty feet. Outcrops of coal and rock, mine shafts, and adits are marked, and the structure of the coal seam is indicated by contour lines showing the elevation above sea level. Copies of these sheets may be had on application to the Director, Geological Survey, Ottawa."

Codes: X1 / J8 / LEGI / IDX_Names: Grand Lake Coal; Albert Mines; Legislation, etc.;
Headquarters - Apr. 5, 1854 (From Mr. Hill's Reports.) House of Assembly, Wednesday, March 29th. ....Mining Leases. - The House next went in committee on Supply, and resumed the debate on there solution for œ2000 to the Government, to buy up the claims of the Lessees of minerals. Hon. Surveyor General read a petition from the ship builders, smiths, and proprietors of foundries in the City of St. John, setting forth that they could not procure the proper kind of coals in sufficient quantities to carry on their works, praying that such steps might be taken as would lead to the working of the coal mines in the county of Queen's, and setting forth their willingness to pay any royalty the Government might think proper to impose, in order that a fund might be raised to pay the lessees for their rights. The hon. member then said a bill had recently passed the House which, if it became law, would vest the right to all the minerals in the owners of the soil, so far as new cases were concerned, but it made no provision to settle the difficulties that now existed, and unless some power was given the Government to settle the claims of the present licencees the mines would be locked up another year. The question then before the Committee was this: would they grant the sum of œ2000, to enable the Government to enter into equitable arrangements if possible, or would they allow the mines to be locked up? Before he sat down he would inform the committee that they must not take the list of applicants for a guide, as in several instances the licences were applied for, but were not issued. Mr. Cutler said he doubted if there was anything in the petition read by the Hon. Surveyor General, whatever stress might be laid on it, that should guide the action of the committee to vote on this grant. The chief claim it was now sought to settle was Mr. Berton's; but however desirable it might be to settle that claim, they must still recollect that other claims would come in, and they would have to deal with them also. He would give much if they could settle the whole affair for ever, but this grant would not do it. He gave the hon. Secretary credit for sincerity in moving it, but it did not go far enough. The Bill that passed the House the other day in reference to the minerals had been greatly magnified; it did not meet the difficulties that had arisen, nor did it attempt to; it merely provided for the 6 future, and legalized what was already in practice, as the Government had issued no mining licence since 1851 except to owners of the soil. - It did not apply to theinjured parties, and was altogether prospective in its character. He considered it all a flourish of trumpets, - a political sham fight. In 1851 he had voted for the grant to Mr. Berton to pay the costs of a suit, because he considered him an injured man. It had been stated by some hon. members that the Government in issuing the licences did not guarantee the parties the statement he would put the opinion of the Attorney General and leader of the late Government, the present Judge Wilmot, who, at the time of issuing some of those licences expressed his opinion that they had a right to enter. And there could be no doubt about the correctness of that opinion, for every man of common sense

must see that it was utterly useless to reserve the minerals, and then grant licenses to mine, if the Government did not reserve the right of entry. He was glad to hear the Attorney General state his opinion so unequivocally on this point, and assert that had it been his own case he would have appealed to England, and carried it before the judicial Committee. It was impossible for common sense to take any other view of the case. As for Mr. Berton's particular claim, hon. members must make up their conclusions that he had lost little by the decision of the Court, because his works were not of an extensive character.When a man attempts to open up a new trade with a foreign country he generally expects to lose at first, but with the prospect of making up for his losses when he has fully established the trade. Now Mr. Berton had sent several cargoes of coals to the United States, in the endeavour to open up a trade with that country, and being deprived of the right of entry by the decision of the Court, he was obliged to abandon his design. The bill that passed the House the other day was all very well so far as it went, but it did not go far enough; it should have provided for the appointment of a commission to inquire into, and examine all existing claims, and report upon them, so that they might all be settled at once. Hon. members were inconsistent at one point; if the affair stood as they represented it, - if the minerals belonged to the landowners from the first - by what authority did they intend to pass a royalty? The bill that passed the House a few days ago merely confirmed, it was said, what the owners of the soil had a right to before; but if they had that right, the Government had no right now to impose additional taxes on them, and if it was necessary topurchase the claims of the lessees, let it come out of the general revenues of the Province. They should adopt some scheme by which all the claims would be investigated. So far as the principle was concerned it mattered not whether it took œ2,000 or œ20,000, but the whole difficulty should be settled by one general scheme. 7 The Asphaltum mines in Albert had no claims, as they were being worked under a special Act of Incorporation. They should carry out the principle on some general scheme, without any reference to the cost, and as this grant did not come up to his views on the subject, as he had now expressed them, he should oppose it. Mr. Johnson said he would not enter into the merits of the bill that passed the House a few days ago; but in reference to the mining leases, there could not be a doubt but the Government at the time of issuing the licences supposed they had a right to enter; the face of the licences showed it, for it was expressly stated that they had a right to erect buildings for carrying on their works, and that had been made use of as an argument in some of the suits. That, he thought, was stronger proof of the view the Government took of it than an expression of opinion in conversation by the late Attorney General. The Government thought they had the power to enter by the reservation, and so did the lessee. He objected to the present grant because it was dealing with an isolated case. The hon. members who had supported it had differed as to their reasons for doing so; one said he wished to settle the claims of the lessees, another wished to settle the difficulties among the people of Queen's County, and a third supported the grant solely upon the ground that he wished to relieve the operatives who were suffering for want of coal, as the opening of the mines would enable them to get that article cheaper than it could be imported. Let them put it on the footing that the lessees had claims which the Government were bound in equity to purchase, and see where they were going to stop. Let them in the first instance take Mr. Berton's claim for damages on account of having been stopped from working under his licence. He had sent several cargoes of coals to the United States in the hope of establishing a market there, and had probably lost money by it at first, and had no doubt, been injured by being obliged to shut up his mine. There was one case clear, if they came to the conclusion that it was necessary to buy up those claims. But he contended that Mr. Berton and the owners of the soil would have effected a compromise before this time, if the Legislature had never held out any hopes of assistance by their interference. Mr. McMahon, the owner of the soil where Mr. Berton's chief mining operations were carried on, knew that he durst not touch the coals himself, and would rather sell Mr. Berton the right of entry than the coals remain untouched and unproductive. If the House had not interfered during the last four or five years, the whole difficulties would have been settled long ago. - Mr. Berton had carried on works under a licence which not only gave him a right to the coals, but the right of entry. That could not be denied. He had been prosecuted by the landowner, and the costs had been paid by the Legislature, and how was it now? He was not 8 before the House by petition endeavoring to get them to take the licences and pay him the damages he had sustained, and they must take care or they would be jumping before they came to the stile. If they purchased Mr. Berton's claim they would have to purchase others; this was but the entering wedge. Then, he would ask where was the great boon they were about to confer on the owners of the soil, by the bill that passed the House a few days ago, giving to them, and their heirs and assigns forever, all the minerals. It was a mighty boon, if they were to be taxed an additional royalty of one shilling and six pence a chaldron until all the claims of the lessees were bought and paid up! The price of coals would not be increased by that additional royalty, as they would find their level in the market, and the money must come from the pockets of the parties who carried on the mines. The argument that the operatives at St. John were suffering would not bear sifting. If ships could not be procured in sufficient numbers to import the necessary quantity of coals from England, it merely showed that they did not offer them what they required for freight. Give them as much as they could make in any other trade, and they would soon get ships enough. But how were they to afford this? it would be asked. Why, the matter regulated itself. If freight was high it showed there was a good demand for ships, and good prices paid, and therefore the shipbuilder could afford to pay high for coals. In fact, the shipbuilder stood in a much better position than he did when the coals were low, for when vessels brought out coals from England as ballast, it showed that there was no demand for ships, and the shipbuilder might as well close up his yard. - it was a boon instead of a loss, as everything went around the circle. Mr. Berton was not before the House by petition, and they did not know that he wished to dispose of the claim, or that he would take the money after it was granted. It was the same with respect to the owners of the soil; the House had nothing before them to show that they would be willing to pay an additional royalty in order that the leases might be bought up. The grant was no bonus either to the lessee or the land owner, but it was a bonus to the operatives in St. John, and to them only. They saw it, and knew it, and therefore they, and they only, had petitioned for it.

They had no more right to receive a benefit by coals being thrown in their way by a grant of the House, than the operatives of Miramichi had to come there and ask for a grant toward paying the freight on the coals. It had been said that if the House passed this grant everything connected with the mining difficulties would be settled; but hon. members who imagined anything of the kind were mistaken; if this passed, more claims would be presented than they anticipated; Albert would come in, with her claims for œ30,000 or œ40,000. There they were mining in earnest; 9 they had two expensive steam engines working, to keep out the water, besides other machinery. He had looked into the subject a little deeper than the Hon. member for Queens had done, - in fact he had been down in the Albert mines, and saw how they were being worked. If they purchased back Mr. Berton's lease for Mr. McMahon's benefit, and gave him what he never purchased and never owned, the parties who had originally owned the Albert mines would apply, although they had leased them for one hundred years. He prophesied that the application would come, and the House could not refuse them because their claim was for thousands instead of hundreds, for that was an argument in its favour. If the House refused to interfere the whole difficulty would be settled before another year elapsed; (No, no!"" from Mr. Earle). He would oppose the resolution because it would benefit the operatives of St. John, and be unfair towards others. If they were willing to pay as much freight for coals as was paid for other things, they would find no difficulty in getting a supply; (Hon. Provincial Secretary, - ""They can't. They want 5000 chauldrons, and can only get 1000."") It was unjust toward the people of the north, and if the operatives of St. John wanted coals, let them pay the market price. Mr. Gilbert had supposed the grant was intended to apply to all disputed claims. - With respect to the rights of the lessees, he contended that the licence did not give them the right to enter. The lands in the county of Queen's which contained coal had been in the possession of the families who now owned them for the last sixty-five years, and it was always considered that they not only owned the land, but all that it contained. Subsequently it was discovered that the lands contained coals, and then strangers came in and procured licences to mine, in preference to the owners of the soil, who tried to procure them and could not, the others, he presumed having more influence. - The licencees had then made entries by force, and the farmers had done their best to prevent them, and this had led to strife and law-suits, which had continued down to the present time, and would still be continued until the Legislature had something to settle them. They saw before them a petition signed by all the ship-builders and foundry-men, and blacksmiths in St. John, in Fredericton, and up and down the river, in favor of a grant to settle all disputes, and saying they were willing to pay an additional royalty for years to come if this were done. It was not one land-owner only whose land contained coal covered by Mr. Berton's license, but eighteen farmers. The hon. Secretary had, a few days ago, endeavored to get the tax taken off coals; that was because the mines were locked up. Let them pass this grant, and they would soon find plenty of coals in the market. Mr. Ryan agreed with the view of the case taken 10 by the hon. member for Kent (Mr. Cutler,) that this grant did not go far enough, but as they could not get all they wished, he would do the next best thing in his power, and should therefore support the grant. The question for their consideration was whether the grant was just or not; as to what the hon. and learned member for Northumberland had stated about other claimants coming in, it ought not influence the Committee, for if it was just to purchase up the licences in the county of Queen's, they should do it. The hon. member had also stated that plenty of coals could be got if people would pay the price for them, but that was not the case; it was not the price the people cared about, but the scarcity, - they were not in the market and could not be bought. An hon. member had stated the other day that coals could be imported from Nova Scotia, but even if that were correct, he would ask if it was not much better to take them from out own mines, and employ our own people? If the grant passed, the Government would not be obliged to pay Mr. Berton all he asked, but they would,

N.B. Courier - Nov. 19, 1836 Notice is hereby given, that the Subscriber, Proprietor and Crown Lessee of Coal Mines on the Salmon River in Queen's County, will apply to the Honorable the Legislature, at its next Session, for the Incorporation of ""The Salmon River Coal Company,"" and that a copy of the Bill to be introduced for that purpose is hereunto 5 subjoined. M.H. Perley. Saint John, 18th November, 1836. A Bill To Incorporate the Salmon River Coal Company. Whereas Mines of Coals and other Minerals are known to exist within this Province - the working of which in an efficient manner would be conducive of great public benefit; and whereas it is thought expedient to engage inthe same by granting them an Act of Incorporation; Therefore I. Be it enacted by the Lieutenant Governor, Legislative Council and Assembly, That --, their Associates, Successors and Assigns, shall be and they are hereby erected into a body politic and corporate, by the name of ""The Salmon River Coal Company"", and shall have all the General powers and privileges made incident to a Corporation by Act of Assembly in this Province. II. And be it enacted, That the Capital Stock of the said Corporation shall be -- pounds of current money of New Brunswick, and shall be divided into One Thousand Shares of --- Pounds each, to be paid in at such times and in such installments as the business of the said Company shall require; Provided that Fifteen per Cent. of the said Capital Stock amounting to -- shall be actually paid in and invested in the business of the said Corporation on within three years of the passing of this Act. And provided also that the said Corporation shall when necessary have leave to extend the said Capital Stock to the sum of -- pounds of like current money, and shall have power to increase the number of Shares accordingly, or to assess such increase upon the original number of Shares. And provided also that the said Corporation shall not be entitled to purchase any property, real or personal, or incur any debts, until the said Fifteen per cent. of the Capital Stock as aforesaid shall be paid in. III. And be it enacted, That the first meeting of the said Corporation shall be held at the City of Saint John, and shall be called by Moses H. Perley, Esquire, or in the case of his death, neglect or refusal, by any two of the said Company, by giving notice in one or more of the public newspapers printed in the said city, at least twenty days previous to such meeting, for the purpose of establishing Bye Laws, choosing five Directors and such other officers as may be necessary for the management of the affairs of the said

Company, which Directors and Officers so chosen shall serve until the first annual meeting, or until others are chosen in their stead, and shall have full power and authority to manage the concerns of the said Corporation, subject to the rules and regulations hereinafter made and provided. IV. And be it enacted, That a general meeting of the Shareholders of the said Corporation shall be held at 6 the City of Saint John on -- in each and every year for the purpose of choosing five Directors and such other Officers as may be necessary for the management of the affairs of the said Corporation, which Directors so chosen shall remain in office for one year, or until others are chosen in their place, and shall at the first meeting after the election choose one of their number President of the said Company. Provided always, that not less than three Directors to form a quorum for the transaction of business, and in case of the absence of the President, the Directors shall have power to appoint one of their number Chairman for the occasion. V. And be it enacted, That no person shall be eligible as a Director unless such person is a Stockholder, and holds not less than -- Shares of the Capital Stock of the said Corporation, and is of the full age of twenty one years. VI. And be it enacted, That the number of votes to which each Stockholder shall be entitled on every occasion, when in conformity to the provisions of this Act the votes of the Stockholders are to be given, shall be in proportion of one vote to each Share of Stock; and that absent Stockholders may vote by proxy, provided such proxy be a Stockholder, and produce sufficient authority in writing. VII. And be it enacted, That the Shares in the said Corporation shall be assignable and transferable according to such rules and regulations as may established in that behalf, but the assignment or transfer shall be valid and effectual unless the same shall be entered and registered in a book to be kept by the Directors for that purpose; that in no case shall a fractional part of a share, or other than a complete share of shares, be assignable or transferable; that whenever any Stockholder shall transfer in manner aforesaid all his Stock or Shares in the said Company, he shall cease to be a member of the said Corporation. VIII. And be it enacted, That if it should so happen that the said Directors or other Officers should not be chosen on the said -- in any year as aforesaid, it shall and may be lawful to choose them on any other day between the hours of twelve at noon and three in the afternoon of such day, on giving fourteen days notice of the time and place of such meeting in one or more of the newspapers published in the City of Saint John; and in case any Director shall be removed by the Stockholders for misconduct or mal-administration, his place shall be filled up by the Stockholders, fourteen days notice of the time and place of the meeting for such purpose being first given; and in case of any vacancy among the Directors by death, resignation, or disqualification by sale and transfer of stock, then and in either of such cases, the said Directors shall and may fill up such vacancy by choosing one of the Stockholders, and the 7 person so chosen by the Stockholders or Directors shall serve until another is chosen in his room. IX. And be it enacted, That the Joint Stock and property of the said Company shall alone be responsible for the debts and engagements of the same. X. And be it enacted, That the said Company shall have the power to levy and collect assessments on the Shares from time to time, of such money, as may be deemed necessary for carrying on the business of the said Company, and whenever any assessments shall be made by the Stockholders of the Company, it shall be the duty of the Treasurer to give notice thereof in a newspaper printed in the City of Saint John, requiring payment of the same within thirty days, and if any Stockholder shall neglect or refuse to pay to the Treasurer the amount of such assessment upon his shares at the time prescribed, it shall be the duty of the Treasurer to advertise all such delinquent shares for sale, at public auction; giving at least twenty days notice of the time and place of such sale, and all shares upon which assessment is not then paid with interest from the time such assessment became due, shall be sold to the highest bidder, and after retaining the amount of the assessment and interest due on each share, and the expense of advertising and selling, the residue, if any, shall be paid over to the former owner, and a new certificate or certificates of the shares so sold shall be made out and delivered to the purchaser. Provided always, that no assessment shall be made, except by a vote of the Stockholders, and a majority of all the shares. XI. And be it enacted, That all meetings of the said Company shall be called by public notice being given of the time and place in a newspaper printed in the City of Saint John, seven days at least before the time of such meeting; and that special meetings may be called by the Secretary under the authority of the Directors, or by the Shareholders representing not less than two hundred and fifty shares of stock , upon giving the like notice. XII. Provide always, and be it enacted, That unless -- pounds of the said Capital Stock, shall be actually paid in for the purposes of the said Corporation, and a certificate of such payment signed and verified on oath by the Directors of the said Company, or a majority of them, (which oath any Justice of the Peace is hereby authorised to administer) shall be filed in the office of the Secretary of the Province, before the expiration of three years after the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years."

Codes: X1 / LEGI / IDX_Names: Grand Lake Coal; Legislation, etc.;
Headquarters - Apr. 12, 1854 (From Mr. Hill's Reports.) House of Assembly, Wednesday, March 29th. Mining Leases. - (Concluded) Mr. Williston said he regretted that the Government had not agreed on a bill giving the licencees the right to enter. In moving for this grant they should have specified to whom the money was to be paid, and in what manner it was to be divided. He contended that Mr. Berton had sustained no damage, as he had only to sink afew feet, and then take out the coal, and the costs of the suit against him had been paid by the Legislature. Why did he not stop then? That was what he ought to have done, and not go on until there was another amount to be pay. This was the most extraordinary application he had ever known, as Mr. Berton was not there by petition, and they did not know that he wished to sell out his claim; he had never before known the Committee of Supply to give away money that was not asked for. But there was another consideration; Mr. Berton had a right of entry on another farm in the immediate vicinity of his former works, and why did he not carry on operations there? Let the people of St. John who wanted coal set him on to work on that part of his lease. But did he intend, or wish, to carry on the mining business any longer? It appeared to him 11 very doubtful, as he

had forfeited two leases by not working under them within the stipulated time, and very probably he would have given up the whole only that he was holding on in hopes to get money out of the Legislature. Since this grant was discussed on Monday, he had made enquiries, and found that if it was carried other applications would come in, and the Province would probably have to pay not less than œ20,000. Mr. McPherson said one would suppose the hon.members for Northumberland owned the whole Province by the way in which they talked, and they seemed to think no coals were required for any place but St. John; but they were wanted all over the country, and they must get them from the mines in the county of Queen's or stay without them. If the hon. member who spoke last had any confidence in the Government he would support it upon the ground that the people must have coals, and could not get them unless those mines were worked. Mr. McPhelim said the more he heard the matter discussed the more firmly was he opposed to the grant. Applications were made to the Legislature year after year, by parties engaged in these coal mines, which showed that they would not support themselves, and whenever it was found that any branch of industry would not support itself, it was better to let it die a natural death than to support it by taxing others. It had been said that the parties would submit to the imposition of a royalty of two shillings and sixpence a chaldron, but if the coals would bear that duty it ought to be collected and paid into the Treasury, and not be devoted to a particular purpose, as the royalty belonged to the people. If they looked to England they would see the price of coals there were up to an unprecedented height, occasioned by money being plenty and labour high; and when they added the high rate of freight from England to this Province the high prices here were sufficiently accounted for, and he did not believe the prices were at all affected by the mines at Grand Lake being closed. The petition from St. John was respectfully signed, but he must oppose the grant, - if for no other reason - because whatever royalty the coals would bear belonged to the people at large. Mr. Jordan had been listening to the debate, and as soon St. John was mentioned he found a local feeling spring up. He considered that these disputes about the minerals ought to be settled, and as there was no other way let them pass this grant, which would be the first step towards it. Even if it should cost a little more than the œ2,000 it was well to settle it. The licencees thought they had a right to enter, and went on working and got themselves into trouble by it; the grant to Mr. Berton in 1851 had arisen out of it, and would not have passed were it not that the licence was supposed to give the right of entry. He had that confidence in the 12 Government that he believed they would make proper enquiries, and make the best arrangements it was possible to make; it was merely lending the money, to be paid back again by the royalty dues. Hon. Attorney General took a review of the debate, and replied to the remarks of several hon. members. He said it had been raised as an objection that Mr. Berton was not before the House by petition, but the hon. member for Queen's was most anxious that Mr. Berton's claims should be brought up, as his licences covered twenty seven square miles, and all the best mining ground was thereby locked up. - He should not vote on the question, as Mr. Berton was his nephew. Hon. Mr. Montgomery said it was a fallacy to suppose that the price of coals was affected by the closing of the mines in the county of Queen's. The price of freight to Europe ranged from forty to fifty shillings a ton, and from England to this country it was twenty or twenty five shillings per ton, while a few years ago vessels brought out coals as ballast. If any grant of this nature were passed it should be after an investigation into all the claims that could be preferred, and should have been general in its application. He believed that if this grant passed, instead of costing the Province œ2000 it would cost œ40,000 before all the claims were paid. Dr. Gordon said a difficulty had arisen out of the Government of former days selling the land to one person, and the minerals to another, without sufficiently defining their respective rights, and now the question arose what should be done? The Committee had nothing before them to show that the œ2000 would enable the Government to settle with all the claimants, and as the additional royalty by which it was proposed to repay this sum into the Treasury would come out of the pockets of all those who obtained leases in the future, it would not be fair, and he could not support the grant. Mr. Earle said the hon. member from Restigouche was altogether mistaken; the coals raised in Queen's were not at all like the coals imported from England; they were better for blacksmiths and manufacturing purposes, and since the mines were locked up they could not be got in sufficient quantities at any price. Mr. Berton was not there by petition, because he was still mining on the lot where he had purchased the right of entry, and doing well by it, and the grant was not intended for his benefit, but to purchase out his claims and allow the parties to mine where they were prevented at present by Mr. Berton's licence. If the grant passed, the Government would investigate the affair, and as they must account for their conduct to the new House he had no fear of the money being misapplied. He was astonished at the conduct of some hon. members who called themselves Liberals; they were anything but liberal on this occasion. The hon. and 13 learned member for Northumberland (Mr. Johnson) spoke well, but his name would appear to greater advantage in the Reports than it would in the Journals. Hon. members talked of bringing in a bill giving the licencees the right to enter? He would like to see them about it! To pass such a measure would be to trample on the rights of the people, and strike at the very foundation of society. He would warn hon. members how they entertained any such idea, for what was the case of the landowners in Queen's today might be their own tomorrow. He trusted that a bill of that nature would never be sustained in the House. Although the hon. and learned member for Northumberland expressed extreme liberalism, he was eloquent, and he (Mr. Earle) oftened listened to him with pleasure; but he did not like to hear him blow hot one day and cold the next. He would say no more, but hoped the grant would pass, as the country was suffering for the want of coals, while they possesses the article in abundance almost at their very doors. Mr. Barbarie said if the statement just made by the hon. member for Queen's was correct, that Mr. Berton was now mining on the shores of the Grand Lake, and doing well, the grant was quite unnecessary, and it was the duty of the House not to interfere with him, but let him go on with his mining operations. He agreed with the hon. Attorney General; he did not believe the decision of the Courts, in this Province was correct. They should have carried their respective cases further. At all events, let Mr. Berton proceed with his work, and then if other applications came they could tell them to go and act in like manner. Mr. Lewis said they ought to do something to settle the matter in Queen's county. He was afraid that other applicants would come forward but the fact was it was impossible just then to get coals fit for manufacturing purposes. He wanted some coals the other day to send up the Bay, and had tried to purchase them in St. John, but there was none to be got. Under these circumstances he would support the grant. Mr. English said the hon. member from Restigouche (Mr. Montgomery) had put the matter in the proper light, in accounting for the high prices; it was the high wages in England, and the high freights. He did not believe the stopping of the coal mines on Grand Lake had raised the price a single farthing. If this grant would settle all the claims, and set the matter for ever at rest, - if any hon. member could certify to the committee that such would be the case - he would go for it. But it would not. If they gave this amount to the persons holding licences in Queen's all others holding licences would come in, and instead of two thousand pounds it would cost œ20,000. The hon. member from Queen's said Mr. Berton was still mining, and getting along well, and if that was the case they should let them alone. - they had got the coals 14 among them, and let them make their own bargains. They (hon. members) were not sent to the House to dispose of disputes of this nature between parties. The people of St. John and Fredericton had petitioned the House, their object being to lower the price of coals, but if they wanted cheap coals he very much feared they would have to wait until the war was over. He would support the grant if he could, but could not do so conscientiously. Mr. Johnson would like the hon. member for Queen's (Mr. Earle) to point out any instance wherein his vote differed from his speech. He challenged him to do so; and if such had ever been the case it could be easily ascertained, for he was generally particular in having the names taken on important questions. The hon. member had defied the House to pass a bill, giving the licencees the right to enter, but such a bill had once passed the House, and it was lost in the Council. Mr. Earle was aware of that, but it was some years ago, and public opinion had been growing stronger upon this question year after year. In 1848, when he first moved in this matter, he had but one hon. member to stand by him, and now he had a majority. The question was then taken on the resolution, when the committee divided as follows: Ayes. - Hon. Messrs. Partelow, Wilmot, Gray, and Hayward, and Messrs. Earle, Gilbert, Robinson, Godard, Jordan, Thomson, Porter, Ryan, Purdy, McLeod, MacPherson, Taylor, and Lewis, - 17. Nays. - Hon. Messrs. Speaker, and Montgomery, and Messrs. Connell, Cutler, McPhelim, Botsford, Johnson, Barberie, Smith, Read, Landry, Williston, Gordon, Rice, English, and Stiles, - 16. Hon. Mr. Montgomery moved the blank be filled up with œ1,000. His. Honour the Speaker then said the resolution had been sustained, but he suggested that the blank be filled up with œ500, - that would be as much as would be required for one year at all events, and it would relieve the Government, for he believed they would be able to do as much with that sum as they would with a larger one. If they granted so large a sum as œ2,000 it would raise the expectations of the people, and they would increase their demands. Hon. Provincial Secretary said the conduct of the Speaker was most extraordinary. - Finding himself beaten after a long debate, he attempted to get rid of the motion by a side-wind, for he knew well - no one knew better - that œ500 would be utterly useless. He had entered the the House from his room and thrown a fire-brand in their midst. The resolution had been sustained by a majority, and several hon. members were absent who were known to be favorable to it, and, that being the case, he would inform the hon. Speaker that the grant should pass this Session; if not in Supply it should by 15 bill. His Honour the Speaker said the hon. Secretary had displayed a degree of warmth that was unnecessary. He had not intended to upset the grant by a side-wind, as he knew a majority of the House was in favour of it; he had merely suggested a smaller sum, as the larger one would raise the people's expectations. There was no need of threats. He had no doubt but in the hands of the Government they would do the best they could do with it. Hon. Mr. Montgomery had moved the sum of œ1,000, but he was opposed to the grant in toto. - he did not think the licencees were entitled to receive a single shilling, and therefore he would not press his motion. But threats were useless, - no threats from the hon. Secretary would alter his vote. Hon. Provincial Secretary, - ""I did not expect they would."" Mr. Connell then repeated the objections he had already urged against the grant. Mr. Smith said the hon. Secretary had threatened the House by saying ""the grant shall pass this Session,"" and he might know the opinion of absent members. He had no doubt the Government could carry the grant if they chose to put forth their strength; but he would ask the honorable Secretary if he considered it fair to apply the strength of the Government in this case? The grant was evidently intended to be applied in a personal and peculiar manner to a case in the County of Queen's. But if it passed, hon. members might depend upon it there would be applications from Albert. A few days ago the hon. member from Queen's (Mr. Earle) had moved an Address to His Excellency, upon this subject, but had withdrawn it at the suggestion of the hon. Secretary, who had subsequently placed this grant on the Supply Book, thus interposing the strength of the Government betwixt two individuals. Hon. Provincial Secretary said the hon. member had not put the case fairly. When he (hon. Secretary) saw the hon. member for Queen's resolution, and saw that there were only four or five members opposed to it, and when he saw that the resolution said nothing about money, but called on the Government to settle all claims in the County of Queen's without limiting the amount to be expended, then he thought it time for the Government to interfere, and take care of themselves, as it was impossible for them to settle those claims without money. That was the fair statement of the case. It was forced on the Government by the House, and now, as a majority of the House had sustained the resolution, he would take care that no unfair advantage should be taken by the opponents of the grant. Mr. Stiles said if this grant passed there would be claims sent in from Albert to the amount of œ50,000, and if he was in the House he would support them all. 16 Hon. Mr. Gray said the matter had been forced on the Government, as the House was desirous of putting a stop to the strife and ill-feeling existing in the county of Queen's, and to open the coal mines. As to other claims coming in, they could not, for nearly all the licencees would be escheated. He was very glad the House had sustained the principle of the grant, and he would advise hon. members who were really anxious to have this vexatious question settled, not to cripple the hands of the Government by filling up the blank with a smaller amount than had been at first proposed. Mr. Johnson would ask what was this grant based on? It was based on the mere assertion of the hon. member for Queen's (Mr. Earle) that Mr. Berton would take œ1500 for his claim. Now he (Mr. J.) and his hon. and learned friend from the county of Westmorland (Mr. Smith) had both asserted that if this grant passed, claims would come in from the county of Albert, and that was information as good as the information this grant was based on. The hon. Secretary had threatened that if this grant was lost in Supply it should be carried by bill. Well, let the Government bring in their bill, for that mode would be less objectionable than a resolution in Supply, as a bill would define how the Government should act, and what should be done with the money. The law inference to escheating the licences, merely gave the Government power to escheat when the licence was forfeited, which was very different from purchasing out the claims of a licencee. He would move that the blank be filled up with œ500. After a short consultation as to how the question should be asked, Mr. Johnson withdrew his motion, and the question was put on the blank being filled up with œ2,000, when the Committe divided as follows: - Ayes, - Hon. Messrs. Partelow, Wilmot, Gray, and Hayward, and Messrs. Earle, Gilbert, Robinson, Godard, Jordan, Ryan, Purdy, McLeod, MacPherson, Taylor and Lewis. - 15. Nays. - Hon. Messrs. Speaker and Montgomery, and Messrs. Connell, Cutler, McPhelim, Botsford, Johnson, Barberie, Smith, Read, Landry, Williston, Gordon,

Royal Gazette - Apr. 20, 1870 CAP XVIII An Act Relating to Coal Mines. Passed 7th April 1870. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-That from and after the passing of this Act all veins or deposits of Coal on granted Lands, known assurface veins, and not exceeding two feet in thickness, may be mined and worked, and the said Coal removed,shipped and disposed of, without the payment of any Royalty whatever, any Law to the contrary thereof no twithstanding."

Carleton Sentinel - Apr. 20, 1872 Legislature - (passed this session):An act to incorporate the Knickerbocker Mining and Manufacturing Company. An act to incorporate the Queen's and Sunbury Coal and Iron Mining Company."

Royal Gazette - Apr. 24, 1872 Passed April 12: An Act to incorporate the Queen's and Sunbury Coal and Iron Mining Company. His Excellency withheld his assent to: The Bill to incorporate the Knickerbocker Mining and Manufacturing

Royal Gazette - Jun. 5, 1872 CAP. LXXIII. An Act to incorporate the Queen's and Sunbury Coal and Iron Mining Company.Sec. Sec. 1. Company incorporated. 4. Liability of 2. First meeting, when and shareholders. where held. 5. Joint stock alone 3. Capital stock. liable. 6. Ten per cent of capital, when to be paid. Passed 11th April, 1872 Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. That Gideon D. Bailey, Esquire, M.P.P., Richard P. Yeamans, John S. Covert, Esquire, M.P.P., Archibald Harrison, Esquire, M.P.P., Caleb E. Wetmore, John Cokely, James Kennedy, Ebenezer Williams, Esquire, M.P.P., John Yeomans, George A. Bailey, John E. Flowers, Charles Burpee, Esquire, M.P., the Honorable George E. King, their associates, successors, and assigns, shall be and they are hereby declared to be a body corporate and politic, by the name of ""The Queens and Sunbury Coal and Iron Mining Company,"" and by that name shall have all the general powers and privileges made incident to a Corporation by Act of Assembly of this province, for the purpose of Mining Coal and Iron Ore, and manufacturing Iron, and for purchasing, owning, leasing, taking leases of, or selling mines or real estate required or necessary for these purposes, or either of them, and establishing all necessary works therewith connected, and for the convenient carrying on and managing the same. 5 2. The first meeting of the said Corporation shall be held at such time and place as any three of the above named persons may appoint, by written or printed notices posted in two or more public places in the Parish of Canning, in the County of Queens County, and in the Parish of Northfield, in the County of Sunbury, respectively. 3. The capital stock of the said Corporation shall be twenty five thousand dollars, divided into one thousand shares of twenty five dollars each. 4. Each and every shareholder in said Corporation shall be held liable to the said Corporation for each and every call or assessment made, not however to exceed in amount the stock subscribed by him, for the purpose of enabling the said Company to pay the debts of or to carry on the operations for which the said Company is incorporated, which call or assessment may be sued for by the said Corporation and recovered in any Court of Record within the Province. 5. That the joint stock and property alone of the said Corporation shall be liable for the debts and engagements of the same. 6. That unless ten per cent of the said capital; stock shall be subscribed within two years from the passing of this Act, the operations of this Act shall cease, and the existence of the said Corporation shall be terminated."

Royal Gazette - May 7, 1873 4 CAP. XXIV. An Act relating to Mines within the Province of New Brunswick.Sec. Sec. 1. Companies to keep plans of plans to be filed of Mines. in Provincial 2. Correct drawings of all Secretary's Office. seams, &c. of coal and other 5. What persons shall minerals to be kept. have the right to 3. Surveys from time to time examine books, plans, to be made of all Mines. &c., of Company. 4. Accuracy of surveys, plans, 6. What persons shall &c. to be made on oath; copy have the right to descend into and examine Mines. Passed 14th April 1873. Whereas the Mining business of this Province is increasing, it is thought just and proper that all Mining Companies and parties in this Province shall make accurate surveys of their Mines from time to time, and keep true maps and plans of the same for the information of the Government, and for the land owners or Companies adjoining such mining operations; Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. That all Mining Companies, party or parties, in this Province, shall keep accurate maps and plans of their Mine, comprising all their workings thereof, showing all their shafts, drifts, adits, levels, and all other workings and excavations whatsoever belonging thereto. 2. There shall be kept in the office of all Mining Companies in this Province maps and plans, on which shall be delineated accurate drawings of all the veins, seams or beds of coal, and all other minerals, showing their true magnetic course and angle of dip of the

same. 3. An accurate survey shall be made by the agents of all Mining Companies, or some competent surveyor, from time to time, and the same to be added to said maps and plans as the works proceed; and also a book of registry shall be kept, in which shall be registered accurate magnetic courses of all veins, seams or beds of coal, and other minerals, and also the true course and length of all their drifts, adits, levels, and all other workings and excavations whatsoever belonging thereto. 4. The truth of such surveys, maps and plans, to be sworn to by two or more credible persons principally employed in or about the works and management of such Mine or Mines before a Justice of the Peace, and a true copy of the said maps and plans shall be safely transmitted to the Provincial Secretary's Office at Fredericton as often as once in each and every year, in the month of January. 55. The Surveyor General of this Province, Deputy Land Surveyor, or such person or persons as may be appointed by the Government of this Province, or any land owners or Mining Companies or their agents that have lands or property adjoining such Mine or Mines, shall have a right to see all maps and plans, also the books in which all registered surveys have been kept, and may have full liberty from time to time, or at any time, to make copies or extracts from all or any of the maps and plans of said adjoining Mines, comprising all the shafts, drifts, adits, levels, courses and dip of veins, seams and beds of coal, and all other minerals belonging thereto. 6. And it shall be lawful for the Surveyor General of this Province, Deputy Land Surveyor, land owners and Mining Companies or their agents that have lands or property adjoining such Mine or Mines to enter and go down at any time or times in the said adjoining Mines, to descend by the ropes, guys, engines, or any other machinery or utensils used at any of the shafts belonging to the said Mines, with full liberty to make surveys, views, plumb line and measure all the said drifts, levels and workings, excavations and extensions whatsoever belonging thereto, and by the same ways and means to ascend and come up out of the said Mine or Mines, shafts, pits, or any of them."

Royal Gazette - Sep. 26, 1888 Notice of Granting Letters Patent. Public Notice is hereby given, that under The New Brunswick Joint Stock Companies' Letters Patent Act, Letters Patent have been issued under the Great Seal of the Province of New Brunswick, bearing date the twenty second day of September, A.D. 1888, incorporating Louis G. DeBertram, of the City of New York, in the State of New York, in the United States of America, Doctor of Medicine; C. Red Stevens, Banker; E.W. Clark, Junior, E.E. Denniston, Bankers; John P. Ilsley, Engineer, of the City of Philadelphia, in the State of Pennsylvania, in the United States of America; and Thomas M. Williamson, of Bustouche, in the County of Kent, and Province of New Brunswick, Civil Engineer; for the purpose of the sale and purchase of Real Estate, and the right to acquire by purchase, lease or otherwise the right to mine and deal in Coal and other minerals; the right to buy and sell merchandise, and to carry on a general mining business, by the name The Grand Lake Coal Company, with a total capital of Two hundred thousand dollars, to be divided into two thousand shares of one hundred dollars each. Dated at the office of the Provincial Secretary, at Fredericton, this twenty second day of September, A.D. 1888 R.W.L. Tibbits, Deputy Provincial Secretary."

Royal Gazette - Sep. 11, 1889 Notice. Notice is hereby given, that application will be made for Letters Patent by the undersigned, under The NewBrunswick Joint Stock Companies' Letters Patent Act, for the incorporation as a Company under said Act, of theshareholders of The Grand Lake Mining Company being a Company heretofore incorporated under 25th Victoria, Chapter 28. 1. The proposed corporate name of the Company is The Grand Lake Mining Company. 2. The objects for which incorporation is sought are as follows:- The right of prospecting for, developing mining, preparing, manufacturing, shipment, and dealing in Coal, Oil, Salt, Iron Ore, Stones of all kinds, and all kinds of Ores, Minerals and metals, with the right of acquiring, raising, getting, and working the same, and the right to buy and sell merchandise, and to carry on a general business in such ores, minerals and metals, with such other things as are incidental thereto, 3. The office or chief place of business is to be in the City of Saint John, in the City and County of Saint John. 4. The amount of Capital Stock is $50,000. 5. The number of shares is 2,500, of $20 each. 6. The names, additions and calling of the applicants who are to be Provisional Directors are as follows:- Joshua Turner, of the City of Saint John, in the City and County of Saint John, merchant; Alfred Stockton, of said City of Saint John, Barrister-at-Law; Caleb. W. Wetmore, of said City of Saint John, broker; William B. Wallace, of said City of Saint John, Barrister-at-Law; G. Frederick Fisher, of the City of Fredericton, Barrister-at-Law."

Royal Gazette - Sep. 18, 1889 Notice. We, the undersigned, hereby give notice of our intention to apply for Letters Patent under the provisions of Chapter 9, 48th Victoria, of the Acts of Assembly of the Province of New Brunswick, intituled, An Act respecting the Incorporation of Joint Stock Companies By Letters Patent. 1. The proposed corporate name of the said Company is -The Newcastle Mining Company. 2. The objects of the Company are the right of prospecting for, developing, mining, preparing,manufacturing, shipment and dealing in Coal, Oil, Fire Clay, Iron Ore, Stones of all kinds, and all kinds of Ores, Minerals and Metals, and the manufacture of Fire Clay and Bricks, with the right of acquiring, raising, getting and working the same, and of acquiring or building vessels and navigating the same, and the right to buy and sell merchandise, and to carry on a general business in such ores, minerals and metals, with such other things as are incident thereto. 3. The office or chief place of business of the proposed Company is to be established and situate in the City of Saint John. 4. The amount of the Capital Stock of the said Company shall be Fifty thousand dollars, to be divided into two thousand shares, and the par value of each share shall be Twenty five dollars. 5. The amount of capital stock actually subscribed at the present time is five hundred and sixty shares, amounting to Fourteen thousand dollars. 6. The names of those chosen as the first or Provisional Directors of the said Company are. - David K. Tapley, George H. Waring and Samuel D. Green.

The names of the applicants are - David K. Tapley, City of Saint John, merchant; George H. Waring, City of Saint John, founder; Samuel D. Green, Newcastle, Queen's County, New Brunswick, miner; James Straton, City of Saint John, Barrister; and J. Douglas Hazen, City of Saint John, Barrister. Straton & Hazen, Solicitors for Applicants."

Daily Telegraph - Dec. 4, 1890 New Brunswick Minerals. - The Mining Laws and Regulations Said to be Faulty - Difficulty of Obtaining Accurate Information About Our Mineral Wealth. - Edward Jack - If any one will take a glance at the mining laws and mining regulations of New Brunswick, he will find them to be of the most absurd character, and about as well adapted to prevent progress in the way of the exploration of metalliferous veins as can well be imagined. Besides this, we have no inspector of mines and no record of their output is kept, so far as I can learn on inquiry at the public offices here. We have in New Brunswick large quantities of a metal which, owing to the extensive manufacture of Bessemer iron, is yearly becoming of more importance. I refer to manganese. Various parties interested in the manufacture of iron in the United States, even from such a distance as Pittsburg, are visiting the province in search of manganese properties, and these deposits have attracted so much attention abroad that I received not long since from the geologist in charge of iron and manganese on the geological survey of Arkansas a note, in which he says:- I am engaged in writing a report on the manganese ores of the state of Arkansas, and in this connection am trying to give also a few facts concerning similar ores elsewhere. Mr. E. Gilpin, of Halifax, has kindly given me the records of the output of manganese for different years in Nova Scotia, and has referred me to you for the records of output for New Brunswick. No record being kept, I was unable to give the geologist the information which he desired, and the province thus lost a chance of advertising its very valuable manganese deposits. Grand Lake coal is also an article, to whose cheap production as well as to the selection of its bestvarieties, much more attention should be paid than is now being done. It is the intention of the writer to visit again the coal regions of Grand Lake this winter, and to endeavor to get a meeting of the people residing there who are interested in coal mining, for the purpose of ascertaining their views as to the best way of arriving at the objects above mentioned; and it may be that the provincial legislature may be asked to aid in this development of the coal area of which the province holds so much. Should I do so I will send to the Telegraph a full description of the situation and of the plans which may be proposed to cheapen the production of Grand Lake coal, so that the city of Saint John and the river counties may be supplied with this fuel at the cheapest rate, as also such suggestions as can be got as to the best means to be taken in order to guarantee to purchasers the quality of the Grand Lake coal which may be offered to them. Should such work be undertaken, and a suitable scheme arrived at by those interested in coal at the Grand Lake, for its developments, I trust that the Telegraph will give its valuable assistance in bringing before the legislature a well devised project to advance the coal interests of Queens and Sunbury counties."

Daily Sun - Mar. 1, 1901 Legislature. - ... He was glad to see thatthe mineral resources of the province were again attracting the attention of the government and that an effort is to be made to develop the valuable coal areaslying in the county of Queens and Sunbury. The great scarcity of coal in the past year indicates that there will be a profitable market for all the coal mined in New Brunswick. We are told that the quality of this coal is splendid and that it can be supplied at a much less cost than the coal which is imported from Nova Scotia. If so, every effort ought to be made to develop those

S.J. Star - Mar. 23, 1901 Fredericton, N.B., March 22. - A bill has been introduced in the legislative assembly to incorporate the New Brunswick Central Coal, Iron and Railway Co. The purpose of the company is to construct and operate a railway from Moncton to Fredericton, passing through the coal fields of the Grand Lake district in Queens county. The company asks for power to acquire the Central railwayand to secure running powers over the railway bridge at Fredericton. The capital stock of the company is $190,000, divided into shares of $100 each. The names of the provisional directors of the company are Right Hon. the Earl of Russell, William Leatham Bright, Bernard Charles Malloy, M.P., James Ward Burchill and Sir John H, Puleston, all of England. The head office of the company is at Chipman, Queens county."

Evening Times & Star - Jun. 2, 1910 Mineral Work in New Brunswick. - Licenses to search for minerals have been granted to L.L. Caillaux in Gloucester county; M.C. Holmes and J.F. Eskildson, Kings county; George Gilbert, R. Carr Harris, M.M. Dugas, HenryScott, Geo. Robertson and John Robertson, Gloucester county; F.H. Pete, York county; M. McLaughlin, Queens county; E.M. Sypher and heirs of S. Clarke, Queens county, and Northfield Coal Co., Sunbury county. A license to work has been granted to the Canada Paint Co., in Westmorland county. M. O'Leary, G.N. O'Leary and J.A. O'Leary have been granted a twenty years lease of Lot 92, on the line between Sunbury and Queens county, containing 213 acres."

Morning Freeman - Apr. 16, 1874 Looking For Mines. - Something was said in the Assembly about the money expended in exploring for mines. We are not disposed to find much fault with the Government for an expenditure of this sort, even though it may not be as judicious as it should be, and there does not seem to be any good reason why individuals or companies looking for mines that they may make a profit out of them should not themselves pay the cost of the explorations from which, if successful, they would derive all the immediate benefit. On page 78 of the Auditor's Report appear the following entries:- MINING Receiver General, expenses connected with Diamond Drill, $1,400.00 Samuel T. Gove, on account Grant, 150.00 Francis Hibbard, do. 1,200.00 Wm. Porter, do. 1,000.00 Receiver General, on account Diamond drill 708.22 – $4,458.22A Grand Lake correspondent, in a letter which we have been obliged to overhold for some time, tells something of the work of the drill:- To The Editor of the Freeman. Newcastle Bridge, Canning, Q.C., March,

1874. Sir,- The diamond boring machine purchased by the Local Government to test the existence of the much talked of seam of coal is now considered useless, so far as this, the parties operating with it can only bore 400 feet. They have bored three holes, one 400 feet, one 362 feet, and one 170 feet. This machine arrived at Grand Lake in October, 1872, and they have done in one year and three months what ought to have been done in three months. It appears now that the principle object of Mr. Bailley in recommending this machine to the Government was to develop a seam of coal supposed to be lying on the bottom of the Grand Lake, as coal had been brought up at different times on the anchors of wood boats, and this has led parties ignorant of coal mining to think that by this enterprise they would become rich at once and that the Grand Lake was one solid bed of coal. Had it turned out so, the enterprise would have been a deep laid scheme to develop it with the public money and a company to enjoy it. Dr. Robb set this question at rest as far back as 1857 by requesting a private party interested in mining at that time to make proper investigation. The parties bored thirty-five feet, which Dr. Robb considered was sufficient to prove there was no seam of coal at the bottom of the Lake, only the coal that had floated down the small streams on the ice in the Spring of the year, and some might have been washed off the decks of wood boats and come there by other means unknown to this day. The Local Government has been as liberal as any Government could be in a matter of this kind. Mr. Bailley recommended the machine to the Government through a pamphlet which he received from the Boring Machine Company of New York, and Mr. Bailley was deceived himself. He stated in public that the machine would bore 1000 feet. He is now convinced that it will bore only 400 feet. Mr. Bailley has had the management of the machine. He recommended it to the Government. Mr. Covert recommended the machine to the Queen's and Sunbury Coal and Iron Company, and they accepted it at his request, expecting it would help them to get satisfaction as the company was about sinking a shaft at the time. This company has expended between one and two thousand dollars and the machine was taken away from them after the company voting to bore another hole up in the high land. It is the opinion of miners that a boiling spring wasstruck at Newcastle Bridge at a depth of 190 feet; the water tasted sulphurous and is supposed to come from coal or in close proximity to coal. This company ought to have the machine to develop this locality, or a portion of the money granted for mining operations. This is the encouragement held out to the company by certain gentlemen. We hope they will come to the front now, as it might be too late after the local general election. There is talk going around that a certain gentleman was heard say that the Government sent Messrs. Williams and White to New York to purchase a sheep and when it got to New Brunswick it turned out to be a goat. Now, if this is done to injure Mr. Williams in his election it will have no effect. It ought to be rightly understood that if this machine has turned out a goat, Mr. Bailley went to New York and saw this goat and then Messrs. Williams and White went to purchase it, and shortly after Mr. Covert went to New York and purchased a solid bit, so called. This machine has been very expensive affair and we can see no one party particularly to blame. If Mr. Bailley and Mr. Covert and Mr. Williams will meet face to face they can soon convince themselves of the conversation that took place on the railway last Fall leaving St. John, and the sheep and the goat story can be very nicely settled. The people have entire confidence in the experience they have had of Mr. Williams, and that he is guided by no selfish motives in politics only to give justice to all parties. Yours, &c.,

Codes: X1 / STAT / IDX_Names: Grand Lake Coal; Statistics;

Royal Gazette - May 1, 1833 Statistics of the Trade, Industry and Resources of Canada, and the other plantations in British America. By Henry Bliss, Esquire... Produce of the Mines. - Gypsum and grindstones, lime, coal and iron, have long been among the staple productions of the British Northern Colonies. Mines of copper and lead have been discovered within a more recent period; other and richer minerals are still insupposition; but the first mentioned are so extensive, and raised in such abundance as to form a very considerable article of export trade. Freestone, granite, marble, clay, and slate of excellent qualities exist in various parts, and are there used for the purpose of building. Manganese and antimony are also found, and a 6 small quantity of the former is exported. The mineral resources of the Northern Colonies have by no means been yet explored. Whatever indeed is known has been less the result of inquiry, than of the voluntary, and almost obtrusive, disclosures of nature herself, who has scattered indications of these her gilts on the very surface of the land, and even on the shores of the sea, so that if the eye did not heed them, man's foot would stumble where they lie. Enough, however, has been ascertained to make it unquestionable that the mines of these provinces are destined to become an immense and inexhaustible source of wealth and power. The island of Cape Breton, the eastern parts of Nova Scotia, the country between the Gulf of St. Lawrence and the river St. John, in New Brunswick, the peninsula of Gaspe, in Lower Canada, contain beds of coal of vast extent; and in Newfoundland also, the same mineral is known to exist. These veins which lie near to the surface have for some time been partially opened in various places, and in one or two the pits have been worked to some extent. But within a few years the General Mining Association of London have invested a large capital, about œ180,000, in the mines of Nova Scotia. Piers have been constructed, railroads laid down. Steam boats, mills, shops, and houses built, and every preparation made for prospecting the enterprise on a large scale. About 500 men are already employed in these mines. Coal, coke, tar, and iron, are the objects and produce of their labour. In the last year, 1832, they shipped above 33,000 chaldron of coal, and made about 2,500 of coke. Fifty vessels at a time have been seen waiting at the mines for freights; and from the extension and improvement of their operations, the company expects, apparently with reason, to ship 100,000 chaldrons in the ensuing year. N.B. Courier - May 4, 1833 The stockholders of the New-Brunswick Mining Company, met at the Masonic Hall in this City on Tuesday the 30th ult. pursuant to notice given in the Royal Gazette and other papers, for the purpose of electing Directors for the ensuing year, when the following Gentlemen were chosen: Robert Parker Robert F. Hazen Henry Johnston John Ward, Jun. N. Merritt William Leavitt R.W. Crookshank Geo. D. Robinson John M. Wilmot James Kirk Henry Gilbert E.D.W. Ratchford Stephen Wiggins The Directors of the Company met at the Masonic Hall on Wednesday, for the purpose of electing a President, when Nehemiah Merritt, Esq. was unanimously chosen, and T.L. Nicholson, Esq., appointed Secretary to the Company."

S.J. Daily Sun - Nov. 11, 1884 Up the River. - From St. John to the Tobique, thence to Bathurst. - .... The First Settler on the river (Tobique) was Edward Campbell ..... Mrs. Giberson, the daughter of Mr. Campbell, ...I was shown a very fine piece of quartz, containinggold, which was found in one of the streams flowing into the Tobique....... We soon came in view of the PlasterRocks - a curious formation - looking like red sandstone with white streaks running through it horizontally, and so soft that it can be cut with a knife, without injuring the edge. It resembles very closely the meat of the cocoanut in color and texture. People come from Fort Fairfield in Maine during the winter and pay one dollar for a two horse load, one dollar and a half for a three horse load, &c., and sometimes as many as thirty or forty teams are hauling in one day. It is used for manuring the land and is excellent for a grass crop where the land is worn out. Edgar Bros. at Three Brooks, six miles below, own the plaster rocks and grind them at their mills. They sell the ground plaster for thirty cents a bushel to the farmers. I obtained some beautiful specimens of the rock nut lost them during my trip across the country. The formation isa wonderful freak of nature, and looked at from the water, the rocks assume curious and fantastic shapes. One piece of rock, standing out from the rest, resembles very closely a lion's head, from which likeness it takes its name. It is about seventy five feet high. A few rods up the river, are two springs, issuing from a rock and used by the Indians for medicinal purposes. One of the springshas a saline taste and was called by the Indians Salt Spring. In the olden times, the Indians made pilgrimages to the springs to be cured of all the ills that flesh is heir to. ...."

Kings County Record - May 13, 1932 Salt Springs. - Salt Springs is situated about thirty miles east of the Loyalist city of Saint John and about fifteen miles southwest of Sussex. The name Salt Springs was given because of numerous salt springs in this locality. Years ago salt was made here and salt wells are to be found in many places, the water being a favorite drink of the deer, which come to open places in winter.There is also a mineral spring quite near the main road that has flowed through a pipe sunk to a distance of about 350 feet, which flows winter and summer alike, the water being considered very beneficial in cases of rheumatism, and was bottled and sold under the name Mahpu, being named after the parish in which it is located, Upham, the letters being reversed."

S.J. Star - Nov. 14, 1902 Macadamite Company's Meeting. The annual meeting of the Macadamite Metal Company of Canada was held last evening at Rothesay. The matter of amalgamating with the United States part of the business was briefly discussed and was left over for a special meeting to be called at an early date. The following officers were elected for the ensuing term: E.G. Evans, president; John Palmer, vice president; T.M. Robertson, secretary, and R.L. Johnston, treasurer. John Kilburn, James Robertson, M.P.P., R. Hunt, James Barnes, M.P.P., M.A. Finn and F.A. Jones, directors."

Weekly Record - Fri., Feb. 3, 1903 A meeting of the directors of the Macadamite Company was held in St. John last week. Outside directors present were James Robinson, M.P., Newcastle, and Messrs. John Palmer and John Kilburn, Fredericton. The directors decided to begin immediately the construction of the new factory on the lots leased from the city at the foot of Mecklenburg Street. A single storey wooden building, 40 x 80 feet, will be put up at once."

Weekly Record - Fri., Feb. 13, 1903 Work on the McAdamite Co.'s factory at the foot of Mecklenburg and Queen Streets has been begun by contractor John Adams. The contract calls for completion in thirty days. Mr. Adams is rushing the work with a large staff and expects to have everything completed within the prescribed time. The building will be 40x80 feet and of one floor only, comprising offices, warerooms, mixing room with ten furnaces. As soon as the building is done the work of making the McAdamite, for which there is already a large demand, will be at once begun. The constituents of the new metal will all be imported. The aluminum, which enters largely into its makeup comes from Shawinigan Falls, P.Q., where the Pittsburg Reduction Co., has recently established large works. - St. John Paper."

St. Andrews Beacon - Dec. 22, 1904 The Macadamite Metal Co. is about to start business in St. John. Mr. J.D. Chipman, of St. Stephen, is a director."

Daily Gleaner - Nov. 13, 1911 McAdamite Metal Company. - A meeting of the directors of the McAdamite Metal Company was held here on Saturday afternoon, among those from outside the city attending being Mr. James Robinson, ex-M.P. of Miramichi, and Mr. R.L. Johnson, of St. John. At the conclusion of the meeting it was said that there was nothing of interest to the public to give out. The report that the plant was to be transferred to Detroit or that it was to be sold was denied, but it was said that another meeting would be held here this week."

Company may hold lands, &c., for the 3 purposes of the Corporation. 40. Company may make bye laws to settle differences between stockholders by arbitration. Passed 1st May 1854. Whereas the undermentioned persons, resident in Great Britain, have associated themselves together by Deed for the purpose of working the Quarries and manufacturing and rendering merchantable the produce of certain lands of which they are the lessees, situate in the County of Albert in this Province, and it is deemed expedient as well to encourage an enterprise of public importance, as for the safety and advantage of the parties so associated, that the rights and immunities of a Corporation should be conferred upon them; 1. Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, that Charles Dickson Archibald, Sir Claude Edward Scott, Mark Hunter, William Kilburn, Benjamin Kilburn, and Henry Heald, their associates, successors, and assigns, are hereby declared, erected, and ordained to be a Corporation and body politic by the name of the ""Albert Freestone Association,"" and by that name shall have perpetual succession, and a common seal, and have, hold, enjoy, and exercise all and singular other the general powers made incident to a Corporation by Act of Assembly of this Province, for the purposes of their said Association. 2. That the capital stock of the said Company hereby created shall be twenty thousand pounds sterling, and shall be divided into twenty shares of one thousand pounds each, provided that the money so to be raised shall be laid out in the prosecution and maintenance of the purposes for which the said Company is erected, and purposes properly incident thereto, and in payment of the legal and other expenses incurred in and about the incorporating and establishing the said Company, and to no other use or purpose. 3. That so soon as ten thousand pounds sterling of the said capital stock shall have been subscribed, and five hundred pounds sterling per share shall have been actually paid on such subscribed stock, it shall be lawful for the said Company, and they are hereby authorized and empowered by themselves, their deputies, agents, officers, and workmen, to begin, carry on, and execute all necessary works for the beneficial working of the freestone and other quarries, and the mines, veins, strata, and seams of copper, lead, iron, clay, and all other minerals which shall be found within, on, or under the parcels of lands so demised to the said associates according to the rights and powers conferred upon them by the said demise, provided that nothing in this Act 4 contained shall extend or be construed to extend in any wise to affect or impair the rights of the Crown in or to any such mine or mineral within or under the said lands. 4. That if at any time two thirds or more in number of the stockholders of the said Company for the time being, shall (by themselves or proxies) at a meeting specially convened for that purpose in manner hereinafter mentioned, resolve or declare that the said Company shall be determined and dissolved as from the day of such meeting, or any subsequent day, then and in such case the said Company shall be ipso facto determined and dissolved accordingly, and those of the stockholders of the said Company passing or making such resolution or declaration, or any of them, may declare the same by notice in the London Gazette or other public Journal or Newspaper published in London, and in some one of the public Newspapers published in Saint John New Brunswick, and may sign such notice in the name of and for the said Company; provided also, that if any stockholder of the Company for the time being shall desire to withdraw from the said Company, and shall declare by notice in writing under his hand left at the usual place of business of the said Company in England, that the said Company shall be determined and dissolved as to him, then and in such case the Company shall be ipso facto determined and dissolved as to the stockholder giving such notice, on and from the day of such notice being so left, or on such day subsequent thereto as shall be expressed in such notice, and the stockholders signing such notice shall advertise the same as last aforesaid; but every such stockholder so dissolving the Company as to himself, and his heirs, executors, and administrators, shall remain liable to contribute according to his share or shares rateably with the other stockholders, to make good any deficiency which may exist at the time of such dissolution in the capital and property of the Company, to answer the then liabilities thereof. 5. That if any stockholder in the said Company for the time being shall become lunatic, or of unsound mind, and shall so continue for the space of six calendar months, or die, the Company shall ipso facto be dissolved so far as relates to him; but he, his committee, heirs, executors, administrators, and estate, shall remain liable to contribute according to his share or shares rateably with the other stockholders, to make good any deficiency which may exist at the time of his lunacy or death in the capital and property of the Company, to answer the then liabilities thereof. 6. That the dissolution of the said Company as to any stockholder giving such notice as is mentioned in the Section last but one preceeding, or as to any stockholder becoming lunatic, or of unsound mind, or dying as in the last preceeding Section mentioned, shall not dissolve the said Company as to the other stockholders. 5 7. That if any stockholder in the said Company who shall or may have subscribed for stock as one of the associated in the said recited Deed, shall make default in payment on the days therein appointed of the several sums to be payable by him on account of his stock or share in the said Association on the days so named, or within twenty days thereafter, it shall be lawful for those of the stockholders in the said Company as shall not have made default, at a meeting or meetings to be called for that purpose, to declare the share or shares in respect of which such default shall have been made to be forfeited, and in every such case it shall be lawful for such nondefaulting stockholders to re-allot such forfeited share or shares, and the money (if any) paid in respect of such share or shares shall be applicable to the general purposes of the Company. 8. That all further sums of money (if any) which in the judgement of three fourths in number, at least, of the stock holders for the time being, shall be required for carrying on the business of the Company, shall be contributed by the stockholders rateably, in proportion to their respective share or shares, at such times and in such sums as the stockholders for the time being shall direct, but so nevertheless that no stockholder shall be required to pay more than one hundred pounds sterling at any one time in respect of each of the shares held by him, nor to make any such payment oftener than once in three calendar months, nor to pay more in the whole in respect of any one of such shares than shall make up the total sum of one thousand pounds sterling in respect of any one such share. 9. That if any stockholder for the time being shall omit to pay any such farther call or sum as in the last preceeding Section mentioned, or any part thereof, on the day appointed for the payment thereof, he shall pay to the Company interest at the rate of five pounds per cent per annum on such unpaid call or sum, or the part thereof for the time being unpaid, until the same shall be paid, and if he shall omit to pay such unpaid principal money and interest or any part thereof respectively for more than six calendar months after the day appointed for the payment of such principal money, it shall be lawful for the other stockholders for the time being to dissolve the said Company so far as relates to the defaulting party, and to declare such dissolution by notice in the London Gazette, and in public Newspapers published in Saint John New Brunswick, but the defaulting stockholder, his heirs, executors, and administrators, shall remain liable after such dissolution to the payment of the principal money and interest in payment whereof he shall have made default, and of further interest in respect of such principal money till the payment thereof, and to contribute rateably according to his share or shares with the other stockholders to make good any 6 deficiency existing at the time of such dissolution in the capital and property of the Company, to answer the liabilities thereof. 10. That all rents and payments reserved or payable by or under the above recited Deed, and the cost and purchase moneys of all works, engines, machinery, tools, implements, utensils, and things constructed, done, or purchased in or for the business of the said Company, and all repairs, additions, and alterations of, to, in, or about the same, or the works already constructed, and all rents of offices in England or elsewhere as may be engaged for the purposes of the said Company, and all taxes, rates, assessments, payments for insurance against loss by fire, and other outgoings whatsoever for and in respect of the property of the said Company, as well in New Brunswick as in England or elsewhere, and all salaries, wages, remuneration, and maintenance of all managers, agents, clerks, workmen, servants, and others who shall be employed in or about the business of the Company, and all other moneys which shall become payable for or upon account of the said business, and all losses and damages which shall happen in or about the same, shall be paid, defrayed, and borne out of the said capital and property of the said Company, and the gains and profits from the same. 11. That the stockholders for the time being shall be entitled to the net gains and profits from time to time arising from the business of the Company, in the same shares and proportions in which they shall for the time being be entitled to the capital and property thereof, and such net gains and profits, or so much thereof as the stockholders of the Company for the time being shall think fit to divide, shall from time to time be divided among them when and as often as the said stockholders shall determine, and the residue (if any) of the said net gains and profits shall immediately after the same shall have been ascertained and determined in each year be the general annual account and valuation hereinafter directed to be taken and settled, be either divided among the said stockholders, or be added to the capital of the Company, and become incorporated with and part of the same, as the said Company shall in due course determine; provided nevertheless, that no stockholder shall receive any part of his share or shares of the net gains and profits, as ascertained and determined by any such account and valuation, until he shall have signed the same account and valuation, or a copy thereof, as hereinafter directed, and shall have paid all arrears (if any) due in respect of his share or shares in the said Company, unless the amount due in respect of such calls shall be less than the amount of such stockholder's share of the profits then divisible, in which case the difference shall be paid to him on his signing the before mentioned account or a copy thereof. 712. That it shall be lawful for any stockholder for the time being, with the assent of the other stockholders for the time being, to advance and lend money to the the said Company, and all moneys so lent shall be considered as a debt owing by the Company to the stockholders, leading the same, his executors, administrators, or assigns, bearing interest, at the rate of five possible per centum per annum, payable quarterly, and such principal shall be payable with all interest for the time being owing thereon, after three calendar months notice by the stockholder lending the same to the Company, requiring payment thereof; and such stockholder shall be bound to take back such loan after three months notice to him from the Company requiring him to accept payment of the same. 13. That it shall be lawful for the stockholder for the time being from time to time and at all times to appropriate any unappropriated shares of the stock of the said Company to such person or persons and for such price or prices as they shall at the time of such appropriation think fit, and in the event of any such appropriation or appropriations, the person or persons to whom such appropriation or appropriations shall be made, shall not take or be entitled to or interested in such share or shares, nor have any claim or demand against the said Company in respect of such appropriation or appropriations until he shall have paid the price or prices payable in respect of such share or shares or such portion thereof as the said Company shall determine, and also any proportionate contribution to the capital stock of the said Company, and such price or prices when paid shall be placed to the capital account of the said Company and he applied for the general benefit thereof and that upon payment by such person or persons of the price or prices payable in respect of such share or shares or such portion thereof as the said Company shall determine, he or they shall be entitled to hold such share or shares (but if only part of the price shall have been paid on such share or shares, then conditionally until the payment of the residue thereof) and to attend and vote at all meetings of the said Company; but and to share in the gains or profits of the said Company; but in the case of a party not having paid the full price in respect of his share in the said Company, his share of such gains and profits shall be applied towards the payment of the portion of such price remaining unpaid, and in all other respects the party so taking such appropriated shares shall be entitled to and enjoy by the same rights and privileges in all respects as are enjoyed by the original stockholders; provided always, that if at any time or times it shall be thought desirable by the stockholders to dispose of any one or more of the said unappropriated shares for the sole purpose of increasing the capital of the said Company, and not with a view to 8 appropriate it to any particular person willing or assumed to be willing to interest himself for the benefit of the said Company, such shares shall first be offered to the then existing stockholders, and should there be more applicants for such shares than shares to be appropriated, the same shall be disposed of and distributed by lot in such a manner as the Company may determine. 14. That it shall be lawful for any stockholder for the time being, with the assent of all and singular the other stockholders for the time being, to assign his share or any of his shares in the capital and property of the Company, to any other person or persons (whether previously a stockholder or not) approved of by all and singular the other stockholders for the time being; provided that the number of stockholders for the time being shall not by any such assignment be made to exceed twenty, and that no one of the twenty shares into which the capital and property of the said Company is considered to be divided, shall be subdivided or held by more than one person, reckoning executors or administrators of any stockholder as one person. 15. That on the execution of such assignment by any stockholder or his assigns, such stockholder shall cease to be a stockholder in respect of the share or shares assigned, and such assignee shall become a stockholder in respect of the same share or shares, and upon such terms as to the liability to previous liabilities and losses of the Company, and participation in previous profits and advantages thereof, as may be agreed to, and may be approved as last aforesaid. 16. That the supreme management, direction, and control in all things of the workings of the said quarries, and of the manufacturing, rendering merchantable, and selling the produce thereof, and of the purchase of engines, machinery, tools, implements, utensils, and materials, and of all other business of the said Company, shall be vested in and belong to all the stockholders for the time being, whether resident in England, New Brunswick, or elsewhere, and shall be ordered and conducted at meetings to be held for such purpose in the City of London, or elsewhere in England, once every four weeks, or oftener if desired by the stockholders; and no order or determination shall be made, or business transacted otherwise than at such meeting, or at a meeting specially called as hereinafter is provided; and no order or determination shall be made, or business transacted at any such ordinary or special meeting, unless three at least of the stockholders for the time being shall be personally present; provided always, that if by reason of the absence of stockholders, any meeting, ordinary or special, shall not have been constituted by the presence of three stockholders, and in the opinion of the Manager there shall be any urgent 9 matter of business in connection with the correspondence abroad requiring action before the next ordinary meeting, it shall be lawful for the said Manager, and one or other of the said stockholders, to determine such matter; but in every case, such matter and determination shall be specially reported to the next ordinary meeting of the Company. 17. That all matters in or relating to the business of the Company as to which there shall be any difference of opinion among the stockholders for the time being, shall be decided according to the determination of the majority in number of the stockholders for the time being who shall vote thereon, and each stockholder shall have only one vote, whatever number of shares he may hold. 18. That any three of the stockholders for the time being, or any two of such stockholders, the Manager hereinafter mentioned being one of such two, may by writing under their hands call a special meeting of the stockholders upon any day after the expiration of seven days from notice thereof being sent to the several stockholders resident in Great Britain, and to such stockholder or stockholders generally resident out of Great Britain who shall then happen to be in Great Britain, and shall have given notice thereof, and of his or their addresses in Great Britain, to the Manager for the time being hereinafter mentioned, provided that such notice specify the day of such meeting and the business for which the same is called, and no order or determination shall be made or business transacted at any such special meeting other than the business specified in such notice, and the making of orders or determinations incidental thereto. 19. That every such notice as aforesaid, as well as notices of calls made in respect of shares, and all other communications to be made to the stockholders of the said Company, shall be considered as sufficiently and properly sent, if sent by post, to the address of the stockholder as last given to the said manager, and no stockholder shall be entitled to any such notice unless he shall give such address, and correct and change the same from time to time as circumstances may require. 20. That any stockholder for the time being may empower any other stockholder for the time being, to vote at any and every such meeting as aforesaid by proxy for such first mentioned stockholder, and either by a general authority to vote on any matter or thing which may arise or come to be ordered or determined generally, or at any specified meeting or meetings, or by a special authority to vote on any matter or thing which may arise or come to be ordered or determined, and which shall be specified in the instrument creating such proxy; and any stockholder for the time being, empowered by any other stockholder for the time being, to act as his proxy 10 aforesaid, may also sign, give, or leave any such notice as specified in these presents, and assent or dissent to or from any matter or thing as to which the assent or dissent of a stockholder may be required or expedient, and may sign such general annual account and valuation as is hereinafter mentioned, and generally may act for and on behalf of and in the name of the stockholder so empowering him in respect of the business of the Company, or the management, direct, and control thereof, or the purposes of this incorporation either generally or particularly, as in the instrument creating such proxy shall be expressed. 21. That no one member shall hold the proxy of, or vote or set by proxy for more than one other stockholder, save and except such specially limited proxy as next hereinafter mentioned, that is to say, it shall be lawful for any stockholder or stockholders by any writing under his or their hand or hands, to authorize, empower, and require the Manager for the time being, by a special and limited proxy, to vote on any particular question, matter, or thing, in any particular way; and to be specified in such proxy, and it shall be the the duty of such Manager to record the votes of such stockholder or stockholders upon such particular questions, matters, and things, in the particular way specified in such proxy by such stockholder or stockholders, and that such special and limited proxy shall in respect only of any such question, matter, or thing, suspend any general proxy by such stockholder or stockholders. 22. That the stockholders for the time being shall from time to time appoint one or more of themselves, or some other person or persons, who shall be resident upon the said demised premises, or elsewhere in New Brunswick or Nova Scotia, (but absolutely and entirely subject in all things to the management, control, and direction of the Company, as hereinafter specified) to superintend and conduct the working the said quarries, the manufacturing, rendering merchantable, and selling the produce thereof, the purchase of engines, machinery, tools, implements, utensils, and materials which it shall be thought expedient to purchase in New Brunswick, Nova Scotia, or the United States of America, and generally to transact, superintend, or conduct the business of the said Company in New Brunswick, Nova Scotia, and the said United States; and the stockholders for the time being shall from time to time appoint any one or more of themselves, or some other person or persons resident in England, (but absolutely and entirely subject in all things to the management, control, and direction of the stockholders generally for the time being) to superintend and conduct the purchase of engines, machinery, tools, implements, utensils, stores, and materials which it shall be thought expedient to purchase in England; and the accounts, correspondence, 11 and business of the Company generally in England, and the laying the same in a clear and sufficient way before the meetings of the Company, and the calling of such meetings, and the carrying into effect by order to the Manager and Managers in New Brunswick or Nova Scotia, and otherwise the order and determination of the Company for the time; and every such appointment of Manager as aforesaid, whether resident in New Brunswick, Nova Scotia, or England, shall be revocable at the pleasure of the Company, and subject to any conditions or restrictions they may impose. 23. That in the temporary absence or illness of any such Manager as aforesaid, whether resident in England, New Brunswick, or Nova Scotia, it shall be lawful for the said Company from time to time to appoint any one or two stockholders to transact the business and and perform the duties of such Manager. 24. That every such manager as aforesaid, whether resident in New Brunswick, Nova Scotia, or England, and whether a stockholder or not, shall be paid and allowed such salary or remuneration for his services as the Company shall from time to time determine; and the Company may by any resolution at any meeting duly convened, employ any stocholder or other person upon any special business in the service of the Company at any salary or remuneration which the said Company may think fit; but no stockholder, unless so appointed or employed by such meeting as aforesaid, shall be entitled to any salary or remuneration for any services he may render to the said Company. 25. That the managers so appointed, resident of New Brunswick, Nova Scotia, or England, shall from time to time (subject to the absolute direction and control of the Company generally) engage and employ all such agents, clerks, workmen, servants, and others, for the purposes of the Company, and at such wages, salaries, and remuneration as such managers respectively shall think fit, and may from time to time dismiss all or any of such agents, clerks, workmen, servants, and others, as such managers respectively shall think fit, and shall from time to time (subject as aforesaid) make such purchases and sales, and enter into such contracts and engagements on behalf of the said Company as the Company shall direct. 26. That the bankers of the Company shall be the Commercial Bank of London in the City of London, and the Commercial Bank of New Brunswick at Saint John in New Brunswick, or such other Banks as the Company shall from time to time determine, and all moneys to be paid to the Company as well by stockholders as by other persons, or received by the said company or its managers, clerks, agents, or servants, on account of the said Company, shall be paid into one of the said Banks to the account, and in the name of the said Company, and shall be drawn 12 out of the Bank of the Company in England, and signed by any three of the stockholders for the time being, or by two of the stockholders for the time being, if the manager, being a stockholder, shall be one, and if the manager shall not be a stockholder, then such cheques shall be signed by any two of the stockholders, and shall be countersigned by such manager; and the moneys so deposited in the Bank of the Company in New Brunswick or elsewhere out of England, shall be drawn out by cheques to be signed by such one or more persons as the Company shall from time to time appoint for that purpose. 27. That if any stockholder of the said Company shall in any other manner than is hereinafter directed and authorized, or as shall be from time to time directed and authorized in such behalf by any bye law or resolution of the said Company duly made, draw, accept, indorse, sign, or give any such cheque, bill, note, security, or order as aforesaid, in the name, or on the behalf, or account of the said Company, or which may affect or shall be drawn, accepted, indorsed, signed, or given with intent to affect the property thereof, then every such cheque, bill, note, security, or order, shall be deemed, as between the Company and its stockholders, to have been drawn, accepted, indorsed, signed, or given on the separate account of the stockholder or stockholders drawing, accepting, indorsing, signing, or giving the same and he or they shall accordingly pay, satisfy, and discharge the same out of his or their separate estates, and shall indemnify and save harmless the others of the said stockholders, and their several heirs, executors, administrators, estates, and effects, and the capital and property of the Company from the same, and all actions, suits, costs, damages, and expenses on account thereof; and it shall be lawful for the said other stockholders to dissolve the said Company so far as relates to the said stockholder or stockholders by offending, or any of them, and to declare such dissolution by such notices in England and New Brunswick as are hereinbefore in this Act directed; but such offending stockholder or stockholders, his or their heirs, executors, and administrators, shall remain liable to contribute rateably according to his or their share or shares, with the said other stockholders, to make good any deficiency existing at the time of such dissolutions in the capital and property of the Company, to answer the liabilities thereof. 28. That every stockholder for the time being shall duly and punctually pay and discharge all debts and moneys payable by him to any person or persons whomsoever, and defend and keep harmless and indemnified the others of the said stockholders, and their several heirs, executors, administrators, estates, and effects, and the capital and property of the Company, from his private and separate debts and engagements, and from all 13 actions, suits, costs, damages, and expenses on account thereof; and if any stockholder for the time being shall become bankrupt, or an insolvent debtor, or enter into any composition with his creditors, or shall apply any of the moneys, effects, or property of the said Company to his own use, or to any use other than the proper use of the Company, or shall do, permit, or suffer anything whereby any of the moneys, effects, or property of the Company shall be seized, attached, or taken in execution for or on account of any private or separate debt or engagement of such stockholder, the Company shall ipso facto be dissolved as far as relates to such stockholder; or if any stockholder for the time being shall mortgage or otherwise change his share or shares in the said Company, or do, permit, or suffer any act on behalf or in the name or on account of the Company other than is herein authorized, then and in either of such cases it shall be lawful for the other stockholders for the time being, to declare the Company, so far as relates to such stockholder, dissolved, and give notice thereof in England and New Brunswick as is hereinbefore directed; but such stockholder and his heirs, executors, administrators, assignees, and estate, shall remain liable to contribute rateably according to his or their share or shares with the other stockholders, to make good any deficiency existing at the time of such dissolution in the capital and property of the Company, to answer the liabilities thereof. 29. That proper Books of Account shall be kept both in England and New Brunswick by the Managers to be appointed as aforesaid, or by such other persons as shall from time to time be appointed, and true, plain, and perfect entries made therein of all moneys, works, machinery, implements, tools, utensils, minerals, ores, metals, materials, effects, debts, and other things belonging to or owing to or by the said Company, or which shall be received, paid, sold, or contracted for in the course of the business thereof, and of the names and residences of all persons holding or entitled to hold any share or shares in the said Company, and the number of such shares, and the amount of the interest of each stockholder in the said Company, and all sales and receipts, and of all disbursements or costs, and expenses in respect of the said Company, and of all calls made, and dividends or profits, and interest paid, and of all other transactions, matters, or things in any wise relating to the said business, as are usually written and entered into Books of Account kept by persons engaged in the business of working stone quarries, together with all such circumstances of names, times, and places, as may be necessary or useful for the better manifestation of the state and proceedings of the business of the Company. 30. That as soon as conveniently may be after the end of each and every month a full copy of all matters 14 during the then preceeding month in such of the said Books of Account of the said Company as shall be kept in New Brunswick or Nova Scotia during such month, and of all accounts paid by or on account of the said Company during such month, or owing and unpaid at the end thereof, together with an estimate of the sum likely to be required for the purposes of the Company in New Brunswick or Nova Scotia during the then current month, shall be made and transmitted to the office of the Company in London, and at the same times as nearly as may be, abstracts and copies of such of the said Books of Account and accounts as shall be kept, paid, or owing in England, shall be made and transmitted to the office or place of business of the Company in New Brunswick or Nova Scotia, and all such abstracts, copies of Accounts, and estimates on both sides, and the books from which the same shall have been made or taken, shall before such transmission as aforesaid be audited by persons (who may be a stockholder or not) appointed by the Company, and be duly verified by the signatures of such persons. 31. That it shall be lawful for the said Company during the winter season, when the workmen engaged can no longer be profitably employed at the quarries, to occupy such workmen in cutting timber in the neighbouring forests, and for that purpose and with that view, or for any purpose beneficial to the Company, to purchase or take on lease tracts of timber land, and also to apply for grants of timber land from the Crown; and in the event of any such purchases or grants being agreed on, the same nay be taken and held in the name of the said Company. 32. That on the first day of January in each and every year during the existence of the said Company, a full and general account shall be made and taken of all such works, machinery, implements, tools, utensils, stock of stone, materials, effects, and things, as shall have been constructed, quarried, done, bought, and sold in the business of the Company, in the first of such general accounts, from the day of the commencement of the said Company, and in each of such subsequent general accounts, from the day of the last preceeding general account and of the moneys paid or received therefor, and of all moneys paid during the same period for salaries, wages, and maintenance of managers, agents, clerks, servants, workmen, and others employed by the Company, and of moneys and debts due or owing to and by the said Company, and of all the liabilities of the said Company, and of all such matters and things as are usually comprehended in general accounts of the like nature, taken by persons engaged in the business of working stone quarries, and that a just valuation shall be made of all particularly included in such accounts which require and are capable of valuation, and the amount of the net gains and profits and loss of the Company during such period ascertained 15 and determined; and all the stockholders shall be bound and concluded by such accounts, save and except that if any manifest error to the amount of fifty pounds or upwards shall be found in any such account or valuation, within twelve calendar months after the same shall be so signed, such error shall be rectified. 33. That if and so often as the said Company shall be dissolved as to any stockholder for the time being, by his lunacy, unsoundness of mind, death, or voluntary retirement, or by or in any of the other means or events hereinbefore specified, by or in which the Company is to be dissolved as to any stockholder, then and in such case if the same shall happen before the taking of the first general yearly account and valuation aforesaid, such stockholder, or his estate, shall be entitled to and receive from the Company the amount of all moneys paid or contributed by him towards the capital of the said Company, and to no share of gains or profits, or other payment whatsoever, and such amount shall be paid and borne by the other stockholders, their executors, administrators, or assigns, without interest, at the end of eighteen calendar months after such dissolution, save and except in the case of dissolution by lunacy, unsoundness of mind, or death, in which case such amount shall be paid at the end of nine calendar months after such dissolution; but if such dissolution shall happen after the day appointed for the first general yearly accounts and valuation aforesaid, such stockholder, or his committee, executors, administrators, assignees, or estate, shall be entitled to receive from the said Company such sum of money as his share or shares of the capital and property of the Company shall, upon the then last general yearly account and valuation, amount to, or as such share or shares would have amounted to in case such account or valuation had been taken on the first day of January immediately preceeding such dissolution, and also (in the case of dissolution by lunacy, unsoundness of mind, or death, but not otherwise,) to the share or shares, which if such dissolution had not happened, such stockholder would have been entitled to the next quarter day which shall happen after such dissolution, of the amount of gains and profits (if any) of the said business, and to no other share of gains or profits, or other payments whatsoever; and such sum of money (in case of lunacy, unsoundness of mind, or death,) and share of current gains and profits (if any) shall be paid by the said Company, without interest, at the end of eighteen calendar months after such dissolution, save and except in the case of lunacy, unsoundness of mind, or death, when the same shall be paid at the end of nine calendar months after such dissolution. 34. That every such payment to any stockholder, as to whom the said Company shall be dissolved as 16 aforesaid, his committee, executors, administrators, assignees, or estate, may be made either out of the capital and property of the Company and the then undivided gains and profits thereof, or out of additional moneys to be contributed for that purpose by the stockholders of the said Company for the time being, rateably according to their respective shares, or partly from one and partly from the other of the said sources, as the said other stockholders shall determine; and every share or shares (if any) so discharged shall sink for the benefit of the other stockholders in the capital and property of the said Company, and in augmentation rateably of the shares of such other stockholders. 35. That after any dissolution as aforesaid, it shall be lawful for the said Company to admit into the said Company in respect of the share or shares of any stockholders as to whom the Company shall have been dissolved, any person or persons, whether already a stockholder or not, whom the committee, executors, or administrators of the lunatic or deceased stockholder (if the dissolution shall have happened by lunacy, unsoundness of mind, or death) may name for that purpose, or generally in any case any other person or persons whomsoever, whether already a stockholder or not, provided that not more than one person be admitted in respect of any one share, and that such committee, or executors, or administrators, and nominee or nominees, or other person or persons (as the case may be) do at their or his own cost execute and enter into such assignment, covenants, and other instruments (if any) as may by the said continuing stockholders, or not less than two thirds in number of them, be deemed expedient for constituting such nominee or nominees, person or persons, a stockholder or stockholders in respect of the share or shares in respect of which he shall be so admitted, and binding him and them to perform and observe the provisions of this Charter in respect of such share or shares, and so that the person or persons so admitted a stockholder or stockholders do pay to the stockholder as to whom the Company shall have been dissolved, his committee, executors, administrators, assignees, or estate, all such moneys as he or they shall under the provisions in that behalf hereinbefore contained be entitled to receive from the said Company, or do obtain from him or them a release of the same and of all claims and demands in respect thereof. 36. That after every such partial dissolution as aforesaid, the other remaining stockholders for the time being, or their respective heirs, executors, administrators, or assigns, shall keep the stockholder as to whom the Company shall have been dissolved, his heirs, executors, administrators, committees, assigns, and estate, sufficiently indemnified against all liabilities of the Company, except the liability hereinbefore 17 rovided for of contributing rateably with the other stockholders for the time being, according to the share or shares of the stockholder as to whom the said Company shall have been dissolved, to the deficiency (if any) existing at the time of such dissolution is the capital and property of the Company, to answer the then liabilities thereof.

Royal Gazette - Apr. 18, 1855 Cap XVI. An Act to enable the Dorchester Manufacturing Company of the City of New York to hold Property in this Province. Section. Section. 1. Company may hold 3. Act, when to come in force. property; limit. 2. An Office to be kept in Dorchester. Passed 3rd April 1855. Whereas John Cairns, Edward Allison, James E. Brown, and Frederick A. Peterson, have formed themselves, with their associates, successors, and assigns, into a Joint Stock Company, in the City of New York, in the United States of America, by the name of ""The Dorchester 9 Manufacturing Company of the City of New York,"" to quarry and manufacture Stone in this Province, and are desirous of being enabled to hold real and personal property in this Province as such Company; Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. The Dorchester Manufacturing Company of the City of New York aforesaid, and their successors, shall and may have full power and lawful right and authority to have, hold, own, and enjoy in any way real estate and lands of all kinds in this Province, whether in fee simple or by by lease, or in any other way, and to have and hold personal estate of all kinds in this Province, in any way, and to alienate, encumber, lease, sell, or deal with the same in any manner; provided always, that the real estate so owned by the said Company shall not at any time exceed the value the sum of two thousand five hundred pounds. 2. The said Company shall keep an Office at Dorchester, in the County of Westmorland, and an Agent there for the transaction of business connected with the Company in this Province, service upon whom of all processes, notices, and other documents shall, be deemed sufficient service upon the said Company. 3. This Act shall not come into operation or be in force until the first day of September next."

Royal Gazette - May 23, 1855 Cap. LXIV. An Act in amendment of an act to enable the Dorchester Manufacturing Company of the City of New York to hold property in this Province. Section. Section. 1. Company empowered to hold 2. When Act to come real estate to the value of into operation. œ10,000. Passed 12th April 1855. Whereas by an Act passed in the present Session of the General Assembly, the Dorchester Manufacturing Company of the City of New York are authorized to holdreal estate in this Province to the value of two thousand five hundred pounds, and such personal estate as they may desire, the same not being limited to any amount; and it is necessary that they should be authorized to hold real estate to a larger amount than they are thereby authorized;-Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The said Company and their successors shall have full power and lawful right and authority, and are hereby authorized and empowered to have, hold, own, and enjoy in any way real estate and lands of all kinds in this Province, whether in fee simple, or by leave, or in any other way, to the value of ten thousand pounds, and to alienate, encumber, lease, sell, or deal with the same in any manner, in addition to the power and authority to hold personal estate thereby granted, any thing therein contained to the contrary notwithstanding. 2 2. This Act shall come into operation on the day when the said recited Act comes into operation."

Company incorporated. 8. Deposit on shares may be 3. Capital to be œ50,000. required. 4. Consideration to be 9. Liability for the Company given to the Albert debts. Freestone Association; 10. Acquisition of property authority to issue in the maritime cities of debentures. the United States. 5. First meeting of the 11. Company to keep an office Company, when and where; at Harvey. election of Directors. Passed 12th April 1855. Whereas the Albert Freestone Association lately incorporated by an Act of this Province have agreed to surrender their Charter, and are desirous of obtaining anAct of incorporation in a new form, and it is expedient to grant the same; Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly,-1. That an Act made and passed in the seventeenth year of Her Majesty's Reign, intituled An Act to incorporate the Albert Freestone Association, be and the same is hereby repealed; provided that all liabilities now existing, or which might by any contract hereafter attach to the Albert Freestone Association, together with all rights and immunities, are hereby transferred and made chargeable on the herein created Company. 2. That Charles Dickson Archibald, Sir Claude Edward Scott, Mark Hunter, William Kilburn, Benjamin Kilburn, and Henry Heald, their associates, successors, and assigns, be and they are hereby declared to be a body politic and corporate, by the name of ""Albert Freestone Company,"" and by that name may have succession and a common seal, and have, exercise, and enjoy all and singular the powers and privileges incident to a Corporation, and may hold, possess, and enjoy lands, quarries, tenements, and hereditaments, vessels, craft, goods, and chattels, and may set up and establish machinery and factories, and construct railways, roads, piers, and breakwaters for the purposes of their operations. 3. That the capital or joint stock of the said Company shall consist of fifty thousand pounds sterling, in two thousand five hundred shares of twenty pounds 3 sterling each, which shall be deemed to be personal property, and transmissible and assignable as such, with liberty to increase the said capital to an amount not exceeding in the whole one hundred thousand pounds. 4. That the above named parties having already paid or rendered themselves liable to the extent of eight thousand pounds, in and about the exploiting and working the Albert Quarries, situate in the County of Albert in this Province, shall be entitled to receive from the Company hereby incorporated three hundred shares, deemed to be fully paid up, and the sum of two thousand pounds sterling, in cash, in consideration of which the said Company shall be and become and stand possessed, without the necessity of any further assurance, assignment, or conveyance, of all and singular the lands, quarries, tenements, and hereditaments, houses, buildings, piers, plant, fixtures, tools, effects, and good will of the said Albert Freestone Association, fully and absolutely to all intents and purposes; yielding and paying, nevertheless, to the tenants of the freehold of the said premises, the annual rent of three hundred pounds sterling, and a royalty of half a dollar per ton of fourteen cubic feet for every ton of merchantable stone raised in any one year over and above three thousand tons, and five per centum per annum upon the profits of the said Company declared and divided, with liberty to the said Company to extinguish the said rent and royalty, or one of moiety thereof, by commuting the same, or purchasing the fee simple of and in the said lands, tenements, and quarries, or on one moiety thereof; and on payment therefor, the Directors for the time being are hereby authorized to issue bonds or debentures of the said Company, the payment of which, and the interest thereon, shall be specially charged on the property, and effects of the said Company, as may be therein expressed; provided always, that such bonds shall not bear a higher rate of interest than six per centum per annum, nor have more than ten years to run; and that the same shall be convertible into stock of the Company at par, at any time during the currency thereof; and it shall not be necessary for the holders of the said bonds to register or record the same. 5. That the first meeting of the shareholders of the said Company shall be held at Delmonico's Hotel, in the City of New York, on Saturday the fifth day of May now next, or at such other time and place in the City of New York, Boston, or Saint John, as any three shareholders, or subscribers for shares, of which one of the above named corporators shall be one, shall determine, and of which public notice shall be given in at least one Newspaper published in the said Cities of New York, Boston, and Saint John, at which, or any adjourned or subsequent meeting, the said corporators, and all parties who shall have subscribed for shares in the said Company, may attend in person or by proxy, and proceed to organize the said Company, and elect a Board of Directors of not less than five nor more than nine, and of whom three shall be a quorum. 6. That the said Directors shall be and they are hereby authorized to frame bye laws, not repugnant to the laws of this Province, for the governance, regulation, and management of all the business operations and affairs of the said Company, which shall have the same force and effect to all intents and purposes as if the same were herein fully declared and set forth; a copy of which said bye laws shall be lodged in the Office of the Secretary of this Province. 7. That the annual general meeting of the shareholders of the said Company shall be held at such time and place in this Province, England, or the United States, as the Directors shall determine on the first Thursday of June in each and every year, at which said meeting the Directors for the past year shall exhibit a full statement and report of the affairs of the said Company and the said meeting shall audit and examine the accounts, elect a new Board of Directors for the ensuing year, amend or annul any bye law, and make new ones, and do and transact all other necessary business; and special meetings of the Company may be called by the Directors on the requisition in writing of any ten shareholders; and at all meetings of the Company each shareholder may vote in person or by proxy, each share being entitled to one vote; and no person shall be eligible to be a Director of the said Company, who shall not be possessed bona fide in his own right of at least ten shares in the joint stock thereof. 8. That the Directors of the said Company are hereby authorized to require payment of a deposit of five pounds per share on allotment, and may call up the remainder from time to time as they may see fit, and may sue for and recover any call or calls in arrear with interest; or at their option may declare the shares of defaulters forfeited, and sell or re-allot the same; and no party shall be at liberty to transfer or assign his or her share or shares whilst any call thereon shall be in arrear and unpaid. 9. That the joint stock, property, and effects of the said Company, shall alone be liable and responsible for the debts and

engagements thereof; and no shareholder, in his person or separate estate, beyond the amount of his shares. 10. That the Directors of the said Company shall be and they are hereby authorized to purchase or lease lands and tenements, in or near some one or more of the principal maritime cities of the United States, for depots and yards; and may construct any wharves, piers, cranes, and railways thereon; and set up and work any machinery, and appliances for sawing, shaping, dressing, 5 polishing, and manufacturing the freestone and produce of the said quarries; and may improve the said lands and tenements, and sell, lease, or otherwise dispose of the same, as the said Directors for the time being shall deem meet

Royal Gazette - Apr. 18, 1858 Cap LXX. An Act to amend the Act to incorporate the Albert Freestone Company. Capital stock may be increased; shares reduced in value, &c. Passed 6th April 1858. Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, - That not withstanding anything to the contrary contained in an Act made and passed in the eighteenth year of the Reign of Her present Majesty, intituled An Act to incorporate the Albert Freestone Company, the capital of the said Company may be increased to an amount not exceeding one million dollars; and that the shares of the said Company may be reduced in amount from twenty pounds sterling to ten dollars per share, or such other amount as the Directors of the said Company by any resolution or bye law may determine; and it shall be lawful for the said Company to grant and issue paid up shares in full or in part payment for any real estate, quarries, rights, privileges, property and effects that may be purchased or acquired by or for the said Company; (and that notice of the meeting to organize the said Company shall be given by Charles Dickson Archibald, Esquire, the proprietor of the Albert Quarries at Mary's Point, in this Province, or some one on his behalf, such notice to be inserted in some one Newspaper published in the City of New York,) and that citizens of the United States may be shareholders and Directors of the said Company."

Royal Gazette - Apr. 18, 1858 Passed recently: An Act to amend the Act to incorporate the Albert Freestone Company."

Royal Gazette - May 4, 1859 Cap LIX. An Act to enable the Dorchester Olive Freestone Company, of the county of Richmond, State of New York, to hold Property in this Province. Section. Section. 1. company empowered to hold 2. Company to keep an real estate in this Province. Office and Agent in this Province. Passed 13th April 1859. Whereas Lorenzo M. Arnold, Silas M. Stilwell, James M. Arnold, William P. Lee, John L. Taylor, Thomas Munroe, and Albert Horn, have formed themselves, with their associates, successors, and assigns, into a jointstock Company, in the County of Richmond, State of New York, in the United States of America, by the name of ""The Dorchester Olive Freestone Company,"" to quarry and manufacture Stone in this Province, and are desirous of being enabled to hold real and personal property in this Province, as such Company; - Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. The Dorchester Olive Freestone Company, of the County of Richmond, in the State of New York afore said, and their successors, shall and may by that name, have full power and lawful right and authority to have, hold, own, and enjoy in any way, real estate and lands of all kinds in this Province, whether in fee simple or by lease, or in any other way, and to have and to hold personal estate of all kinds in this Province, in any way, and to alienate, encumber, lease, sell, or deal with the same in any manner; provided always, that the real estate so owned by the said Company shall not at any one time exceed in value the sum of ten thousand pounds. 2. That the first meeting of said Corporation shall be held at such time and place in this Province as may be appointed by a majority of stockholders. 6. Unless twenty five per cent of the capital stock shall be subscribed within one year from the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation shall terminate."

Royal Gazette - May 1, 1861 Cap. XLVI. An Act to amend an Act intituled An Act to incorporate the Westmorland Olive Freestone Company. Act 22, V.c. 84, a.6, repealed. Act to be void if a certain subscription be not made. Passed 12th April 1861. Whereas in and by the sixth section of the Act to 9 incorporate the Westmorland Olive Freestone Company, it is enacted that ""unless twenty five per cent of the capital stock of the said Company shall be subscribed within one year after the passing of this Act, the operation of this Act shall cease, and the existence of the said Company shall terminate;"" And whereas it is desirable to extend the said limitation to a further period of two years from the ninth day of April in the year of our Lord one thousand eight hundred and sixty one;-Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, - That the sixth section of an Act made and passed in the twenty third day of the Reign of Her present Majesty, intituled An Act to incorporate the Westmorland Olive Freestone Company, be and the same is hereby repealed; and in lieu thereof be it enacted, that unless twenty five per cent of the capital stock of the said Company shall be subscribed within two years after the ninth day of April in the year of our Lord one thousand eight hundred and sixty one, the operation of this Act shall cease, and the existence of the said Company shall terminate."

Royal Gazette - Jul. 19, 1865 Cap. LVI. An Act to enable the Dorchester Union Freestone Company of New York to hold property in this Province. Section. Section. 1. Company may hold property. 2. Office of Company, where kept. Passed 8th June, 1865. Whereas certain persons in the State of New York, in the United States of America, have formed themselves, with their associates, successors, and assigns into a Joint Stock Company, by the name of ""The Dorchester Union Freestone Company,"" to quarry and manufacture Stone in this Province, and are desirous of being enabled to hold real and personal property in this Province, as such Company:- Be it therefore enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. The Dorchester Union Freestone Company of New York, in the State of

New York aforesaid, and their successors, shall and may by that name have full power and lawful right and authority to have, hold, own and real estate and lands of all kinds in this Province, whether in fee simple or by lease, or in any other way, and to have and to hold personal estate of all kinds in this Province in any way, and to alienate, encumber, lease, sell or deal with the same in any manner; provided always, that the real estate so owned by the said Company shall not at any one time exceed in value the sum of sixty thousand dollars. 2. The said Company shall keep an Office in Dorchester, in the County of Westmorland, in this Province, and an Agent there, for the transaction of business connected with the Company in this Province, service upon whom of all processes, notices, and other documents, shall be deemed sufficient service upon the said Company."

Royal Gazette - Jul. 30, 1873 CAP. LXXXIX. An Act to incorporate the Hopewell Freestone and Mining Company. Sec. Sec. 1. Company incorporated. 6. Shares assignable. 2. Capital stock. 7. Joint stock alone 3. First meeting, when held liable. And how called. 8.Time within which ten 4. Annual meetings, how per cent must be paid appointed, proviso. In. 5. Powers of Directors. 9. Where Office of Company shall be kept. Passed 14th April, 1873. Where as the Township of Hopewell, in the County of Albert, offers advantageous situations for the quarrying and working of freestone, marble, limestone and other building materials, and for quarrying and manufacturing plaster, and for mining purposes; and whereas a Company has been formed for the purpose of quarrying, mining and working the same, and other business connected therewith, at Hopewell aforesaid, and have expended a considerable amount of capital, and the expenditure of capital and the employment of labour in such operations would be a benefit to this Province, it is deemed right to afford encouragement and protection to the said Company, and to facilitate their operations by an Act of incorporation:-Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:-1. That George K. Snow, Joseph Hayden, Robert K. Snow, and Joseph H. Hayden, and such other parties as shall from time to time become proprietors of shares in the Company hereby incorporated and established, their successors and assigns, shall be and they are hereby erected into a body politic and corporate under the name and style of ""The Hopewell Freestone and Mining Company,"" and by that name shall have a common seal, sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended in all Courts and places whatsoever, and shall have power, right and authority to purchase, hold and enjoy lands, tenements and hereditaments for them, their successors and assigns, and all other the powers and privileges made incident to a Corporation by Act of Assembly in this Province, for the purpose of erecting cranes, wharves and other machinery for the purpose of quarrying, manufacturing and exporting building stone and other stone and other valuable material, and for opening and working of mines and minerals and all other business connected therewith in this Province, and for carrying on and managing the same, and also the constructing and making of such railroad or other description of road as may be necessary for the transportation and shipment of the said building stone and all other articles, and also that they the said Company or a majority of them shall from time to time have full power and authority to construct, ordain, make and establish such bye laws and ordinance as may be deemed necessary for the good rule and government of the said Corporation; provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes in force within this Province. 2. The capital stock of the said Corporation shall be one hundred thousand dollars of current money of the Dominion of Canada, and shall be divided into two thousand shares of fifty dollars each, to be paid in at such times and instalments as the business of the Company shall require, when duly ordered by the Directors, and every person who shall be a holder of one or more shares shall be entitled to vote either in person or by proxy, having one vote for each share as aforesaid, and it shall be lawful for the said Corporation to grant certification of full stock in whole or part payment for the consideration of lands, quarries, buildings, wharves, machinery, mining rights or privileges, in the place of money subscription to said stock, at such valuation as a majority of all the subscribers shall fix. 3. The first meeting of the said Corporation shall be held at Hopewell aforesaid, and shall be called by George K. Snow, or in the case of his death, neglect or refusal, by any two of the said Company, by giving notice in one or more papers printed in the said County of Albert, or any County adjoining the said County, at least thirty days previous to such meeting, in order to organize the said Company and for the purpose of establishing bye laws, choosing Directors and such other officers as may be necessary, which Directors and officers so chosen shall continue in office until the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present at the meeting or appearing by proxy, shall organize said Company, establish bye laws and choose Directors of the said Company by a majority of votes. 4. The shareholders shall meet annually at such time and place as may be appointed and regulated in and by the bye laws of the said Company, at which meeting the shareholders present or by proxy may either re-elect the Directors before appointed, or any of them, or elect other Directors in the stead of all or any of them; provided always, that the omission to meet shall work no forfeiture, but the shareholders may be afterwards called together for that purpose by one or more of the Directors of the said Company for the time being, or by any three of the shareholders. 5. The Directors and officers of the said Company, or a majority of them, shall have full power and authority to manage the business and concerns of the said Corporation, subject to the bye laws of said Corporation and the provisions herein contained, may appoint and employ any agent or other persons by them deemed necessary, may declare annual or semi-annual dividends or profits as ascertained by them; but no person shall be eligible as a Director unless he be a stockholder and of the full age of twenty one years. 6. All the shares in the said Company shall be numbered in progressive order, and every member of the said Company shall have a certificate under the seal of the said Corporation, and signed by the President and Clerk or Secretary thereof, certifying his property in such shares as expressed in the certificate, and the shares of the said Corporation shall be assignable in the form directed in the said bye laws, and such assignee shall thereupon become a member or stockholder in the said Company; and whenever any stockholder or shareholder shall assign or transfer his stock or shares in the said Company, he shall cease to be a member of the said Corporation. 7. The joint stock and property of the said Company shall alone be responsible for the debts and engagements of the same. 8. Provided always, that unless ten per cent of the capital stock shall be paid in for the purposes of the said Corporation, and a certificate of such payment signed and verified on oath by the said Directors or any one of them, (which oath any Justice of the Peace is hereby authorized to administer) shall be filed in the office of the Secretary of the Province before the expiration of three years after the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years. 9. The said Company shall keep an office in Hopewell, in the County of Albert, in this Province, and an Agent there, for the transaction of business connected in this Province; service upon the said agent of all writs, processes, notices and other

Carleton Sentenil - Mar. 31, 1877Acts passed.... An Act to incorporate the New Brunswick Freestone Company."

Royal Gazette - Apr. 4, 1888 Public Notice. Notice is hereby given, that the undersigned intend applying for the issue of Letters Patent, pursuant to the provisions of Chapter 9, of the Acts of Assembly of the Province of New Brunswick, passed in the year of our Lord one hundred and eighty five, intituled An Act respecting the incorporation of Joint Stock Companies by Letters Patent, for the incorporation of a stone quarrying and working Company. 1. The proposed corporate name of the Company is the Atlantic Brown Stone Company. 2. The object for which incorporation is sought is, the quarrying, working, manufacture, sale, shipping, and exporting of building and other stone at Wood Point, in the Parish of Sackville and county of Westmorland, and at other places in the Province of New Brunswick and elsewhere; the purchasing and working of quarries of building stone, grindstones, &c.; the building and purchasing of railways, tramways, wharves, derricks and machinery, and the doing of all things requisite for or incident to carrying on the business of quarrying and shipping stone in the Province of New Brunswick and elsewhere. 3. The Office or chief place of business of the Company is to be established at Wood Point in the Parish of Sackville, in the Province of New Brunswick. 4. The amount of Capital Stock of the Company actually subscribed is $24,000. 5. The number of shares is two hundred and forty, and the amount of each share is $100. 6. The names, addresses and calling of each of the applicants is as follows:- Joseph B. Read, of Sackville, in the county of Westmorland, and Province of New Brunswick, Merchant. Henry C. Read, of Stonehaven, in the county of Gloucester, and Province of New Brunswick, Merchant. Henry R. Emmerson, of Dorchester, in the county of Westmorland, and Province of New Brunswick, Barrister. Stephen Clark, of Sackville, in the county of Westmorland, and Province of New Brunswick, Merchant. Walter R. Wood, of the City of New York, in the State of New York, Stone Merchant. John Lord, of the City of New York, in State of New York, Stone Merchant. Rufus Seaman, of Minudie, in the County of cumberland, and Province of Nova Scotia, farmer. George Hibbard, of Lower Cove, in the County of Cumberland, and Province of Nova Scotia, Merchant. Amos Seaman, of the City of Boston, in the State of Massachusetts, Merchant. Dated this 2nd day of April, A.D. 1888."

Royal Gazette - Apr. 27, 1892 Notice of Application For Letters Patent. Notice is hereby given, that the undersigned will make application to the Lieutenant Governor in Council, for Letters Patent under the Great Seal, for a Charter constituting the undersigned, and such other persons as may become shareholders in the Company thereby created. a body corporate and politic, under the provisions of The New Brunswick Joint Stock Companies Letters Patent Act of 1885 and Amending Acts. The proposed corporate name of the Company is The Moncton Freestone Company. The object for which its corporation is sought is - to purchase, own, sell and deal in stone quarries and lands, privileges and facilities in connection therewith, to quarry, manufacture, purchase, sell and deal in stone for all purposes, and such other things as are incident thereto. The chief place of business is to be the City of Moncton, in the County of Westmorland. The capital stock of said Company is to be $10,000, divided into 100 shares of $100.00 each. The names in full, address and calling of the applicants are as follows, the first five of whom are tobe the first or Provisional Directors of the Company:- Names. Address. Calling. Theophilus B. LeBlanc Moncton. Contractor. Thomas Fitzsimmons Moncton Contractor. Robert A. Borden Moncton Barrister Matthew Lodge Moncton M'fg. Agent Philip. D. Bourque Moncton Quarryman"

Chignecto Post - May 4, 1893 New Stone Company.- The Royal Gazette containsnotice of the application for incorporation of a local company to carry on a quarrying business at Wood Point or elsewhere. The notice says: 1. The proposed corporate name of the Company is The New Brunswick Brown Stone Company . 2. The objects for which such incorporation is sought, are: The carrying on of a general business for the quarrying, manufacturing and purchase and sale of Building and other Stone; and also for the acquiring andholding of lands, buildings, machinery and other property for the purposes of said business and incidental thereto. 3. The Office or chief place of business of the said Company shall be in Sackville, in the county of Westmorland, in the province of New Brunswick. 4. The amount of the capital stock of the said Company will be ten thousand dollars, divided into two hundred shares of fifty dollars each, upwards of five thousand dollars of which said capital stock will be actually subscribed before the issuing of such Letters Patent. 5. The following are the names and addresses and callings of the several applicants, all of whom are to be the first and Provisional Directors of the Company:- Stephen Clark, of Sackville, in the County of Westmorland, New Brunswick, Merchant; William Clark, of Sackville, in the county of Westmorland, N.B., Merchant; Josiah Wood, of Sackville, in the County of Westmorland, N.B., Merchant; William Milner, of Sackville, in the county of Westmorland, N.B., Master Mariner; Henry A. Powell, of Sackville, in the county of Westmorland, N.B., Attorney-at-Law. There is an unlimited quantity of superior stone at this point and under energetic management an extensive business can be developed."

Colonial Farmer. - May. 29, 1871 Geological Report. - Continued. From the escarpment of the mountain the ground slopes tothe southeast at a low angle, probably in conformity with the dip of the underlying grey grits, which flank the narrow coping of trap. Near the bridge the river divides into three branches, and on the northeast branch, about one and a quarter miles from the Forks, occur the Falls of Nashwasis. - Here the brook, running in a picturesque gorge formed of nearly perpendicular cliffs of yellowish grey sandstone, 100 feet apart, and about the same height, falls over course silicious conglomerate rocks, forming a cascade of forty feet high and fifty feet in width. Both the cliffs above, and the conglomerate forming the bed of the stream at the fall are copiously charged with vegetable fossils, such as leaves and stems, the latter sometimes of considerable thickness, the bark being converted into coal, and the core replaced by sandstone; nodules of iron pyrites are also very abundant. Although such traces of carbonaceous matter abound, there seems to be nothing to justify the expectation, which has been entertained by some of the neighboring residents, that a workable seam of coal may be found here. Rumours were current also, when I visited the locality, of veins of manganese and even of more valuable ores having been found on McLeod's Mountain, together with great deposits of fine red ochre in the vicinity, but as they were not met with by me, I am unable to give any details. Just below the fall there is a considerable development of a pure white siliceous conglomerate, composed entirely of large quartz pebbles, and without a grace of organic remains. From the mouth of the Keswick, northeastward as far as Tay Settlement, a distance of fifteen miles, the hardness of the outcropping edges of the grey grits and conglomerates, combined with the unequal effects of superficial denudations, produces a very marked topographical feature, forming a succession of nearly 10 parallel ridges running northeast and southwest as far as the valley of the Nashwaak, and all of very considerable elevation up to 900 feet above tide water. Most of the rock exposures observed by me in this district have been recorded on the large map, and need not be here repeated. In this intervale the red rocks are nowhere conspicuously displayed, owing to the relief of the surface, the nearly horizontal attitude of the strata, and the soft nature of these rocks themselves. In the valley of the River Tay, however, they reappear in considerable breadth, as might be expected from the fact of its cutting the formation traversely. At Beone's Mills, about eighteen miles from Fredericton, on the north branch of the Tay, and near the road between Cardigan and Tay settlement, fossiliferous and highly ferruginous grey grits occur in alternating massive and shaly beds, dipping SE 7ø, with specular iron and impressions of large and small obscure fossil vegetable remains. A little further north, at the bridge over the south branch, thin bedded micaceous red sandstones appear, dipping SE apparently 17ø; this is at the junction of the red and grey rocks. Proceeding one and a half miles northward on the road, we find at the bridge over the North Tay, the contorted and nearly perpendicular slate and quartzite of the unconformable metamorphic rocks, seamed with quartz veins, and slightly calcareous, but only so in streaks and bleaches. On descending the stream (but ascending in stratigraphical order) the slates become gradually more calcareous, arenaceous and micaceous, and assume a red colour, till at a little over half a mile below the bridge, they are covered by the unaltered bed of red marl and conglomerate, dipping SE 7ø. The section afforded in the bed and banks of the Tay is tolerable complete distinct, cutting nearly transversely to the direction of the Carboniferous rocks, extending for a distance of about ten miles from their base, and including two small seams of coal. Where coal has been found the seams themselves are concealed, and neither the quality nor conditions of occurrence of these coal seams have been accurately established; but their appears no reason to believe them to be of any economic importance, as no true underclays have been found in this section of the country, and even the continuity of the coal beyond the spot where it has been found has not been ascertained. Between Tay Settlement and Stanley, on the Nashwaak, on the land of Robert Thorburn, an interesting exposure of the red calcareous conglomerate and underlying metamorphic slate rock, in vertical section, is afforded in a small ravine or gorge. The slate rock at and for some distance below the plane of contact is also calcareous, and seamed with strings of quartz and calcspar; in the same neighborhood this rock was manyyears ago successfully burned in a kiln for lime. A similar conjunction to the last is well observed, though in horizontal exposures, in descending the River Nashwaak, where, about a mile below Stanley Bridge, the slates, reddened and rendered highly calcareous towards the contact, are overlapped by the red conglomerate, sandstone and marl, which continue uninterruptedly in descending, for a distance of one and three quarter miles, equivalent to a thickness of about 1000 feet; and terminate near the mouth of Cross Creek, there giving place to light-grey sandstone and conglomerate in massive beds. At Red Rock settlement and also at the mouth of Cross Creek, eruptive masses of trap protrude through the red conglomerate near the summit. At Nashwaak Bridge, on the Miramichi Road, thin-beddedflaggy grey grits are seen on the bed and bank of the river, dipping SE 5 deg.; and the same rocks are occasionally displayed at intervals along the Portage road to Boiestown. About ten miles from Boiestown the road skirts to a considerable extent, of red conglomerate, terminating towards the east of an eruptive mass of basalt similar to that at Clarke's Mountain, but more vesicular. It forms the height of land on the Portage, and is about three-quarters of a mile wide, terminating at Clearwater Brook, a tributary of the Taxis River; the other dimensions and precise form of the mass have not been fully ascertained. From Boiestown eastward for three or four miles, the right bank of the Southwest Miramichi is flanked by an amphitheatre of the coarse grey sandstone rising to the height of 200 feet above the river, and dipping SE 5ø; the line of this escarpment is considerably to the south of that of the bluffs at Keswick, Cardigan, etc. Near the mouth of the Taxis River, which flows into theMiramichi a little above Boiestown, a small seam of coal about three inches in thickness was reported. Four miles up the Miramichi from the mouth of the Taxis, the horizontal grey fossiliferous sandstones overlie red conglomerates and marls, dipping 67 deg. to the southeast. This high dip, of which some of the beds of the grey grits also seem to partake, may be due to a fault; in corroboration of which hypothesis the underlying metamorphic slate is usually full of veins of quartz and calcspar, as if much fractured; but on the other hand it is to be noted that with the observed horizontal breadth of the red rocks (400 yards) the thickness would closely approximate to that usually obtained for the red rocks, (1000 feet). The grey sandstones near this locality yield very fair though rather fine-grained grindstones; and some of the red marls might be

NB. Courier - Sep. 16, 1837 LETTER 1. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May it please your excellency;The important measures which have been adopted for thewelfare and prosperity of New Brunswick, by the Executive and Legislative Branches of the Government, since your Excellency's arrival in the Province, have produced the highest satisfaction among the inhabitants of that flourishing and loyal Colony. And although but a few months have passed away, since the country has enjoyed the benefit of your Excellency's talent and experience,it is already known that the veteran soldier is also the wise statesman under whose care science, industry, and lawful enterprise are protected, and have even now received a new impetus in their numerous departments. With a knowledge of these facts, I beg permission to address the following letters to your Excellency, knowing that whatever they may contain of an useful character, will be received with the patronage their author would endeavour to merit. The importance of examining the structure of the earth, with a view to unfold its valuable resources, must be evident to all who consider that mineral substances are indispensibly necessary in all the arts and sciences, and every work which man is called upon to perform. They form the powerful instruments of war, they supply the blessings of peace, and diminishing animal labor, they afford abundant means of happiness and health. By them agriculture, manufactures, and commerce are sustained, and the prosperity of every country depends upon their discovery and employment. None of the sources of national independence and wealth, have contributed so largely to the civilization of mankind, as those of the mineral kingdom, whose treasures also admirably display the intelligence and power of their All-wise creator. It is true that by viewing them the mind feels its own weakness, although it can hardly fail to behold the beauty and order of their arrangement. If such remarks will in any way apply to countries where vast mineral deposits are giving out their valuable contents to the benefit of their inhabitants, how much more must they be acknowledged to be correct in a Province, into which even granite and limestone were imported a few years ago. But instead of pursuing farther a prefatory part of the subject, I proceed to lay before your Excellency such observations as have been made by personal examination. And without confining them entirely to Geological and Mineralogical detail, will endeavor to give the result of my enquiries in other branches of natural science, with some

topographical matter collected on a tour through the country. Having been requested by M.H. Perley, Esquire, the active agent of the Salmon River Coal Company, to examine the Coal formation on the Grand Lake, in New Brunswick, it was deemed necessary to ascertain, if possible, how far the strata of that place were connected with those of Nova Scotia, and how far the Coal districts of the two Provinces were united. On the boundary line between the two Provinces, there is an extensive Coal Field, having a large part of the county of Cumberland on one side, and a part of the county of Westmorland, belonging to New Brunswick, on the other. The coal district has been denuded by the action of the sea, and its rapid tides on the coast of the Bay of Fundy, and by the steady action of the waters flowing along numerous rivers taking their rise from the higher lands of the interior; and long since the coal with its accompanying strata of sandstone, shale and limestone were deposited, vast portions of each have been worn down, and carried away by tidal currents, and torrents ever rushing onward toward the sea -- That the strata of sandstone and other rocks, were once perfect and continuous from one side of Chignecto Bay and Cumberland Basin to the other, there can be no doubt. The strata of Cape Enrage, Cape Maranguin, and Grindstone Island, and those of the opposite coast on Nova Scotia side, are identical in structure, mineral composition, and inclination, and may be seen at low-water, reaching out beneath the sea, pursuing a direct and uniform course. Chignecto, and Shepody Bay, Cumberland Basin, and the numerous rivers and creeks emptying into them, almost intersect this coal field; and have by their unremitting currents, exposed beautiful sections of the rocks now forming their shores. The detritus produced by these causes, frost, rain and atmospheric influence, has been deposited in lakes, estuaries, and on the sides of creeks, forming those extensive marshes, now skirting the rivers of this fertile country. The same causes that reduced the hard rock to an almost impalpable powder, have transported the sedimentary matter to those situations where it is now found, until it rose to the highest level of the sea, and formed a soil only inundated at the highest tides. The coal field extends northward and eastward to Northumberland Straits, where the same freestones are quarried that appear on the shores of Chignecto Bay. - The sandstones of Grindstone Island, Cape Meranguin, North Joggins, and Coast of Shepody, are very valuable, as they apply the most durable and elegant slabs for buildings, and also afford the best materials ever discovered for grindstones. Of the latter great numbers are made yearly, and shipped to the United States, and from thence to other parts of the world. They are equal in quality to those found at the South Joggins, and already afford a profitable and extensive trade. These 3 sandstones are generally of a grey color, and composed of fine grains of quartz, with a little feldspar and mica united by an argillaceous cement. The lines separating the strata, (which differ much in thickness), are perfectly parallel, a circumstance which enables the workmen to select such strata, as have a proper depth for the diameter of the stone to be cut; and it is surprising with what facility the compact rock is converted into circular grindstones, which appear like piles of large cheese at the quarries from whence they are taken. The measure of a single stone is 24 inches in diameter, and 4 inches in thickness, but they are often made of much larger dimensions, the price of each of the above size, is from 2s. 6d. to 3s. 6d. These grindstones already form an important export of New Brunswick, and the time is not far distant when they will not only enrich individuals, but also become a source of public revenue and provincial wealth. From the rocks of the Coal Basin of Chignecto Bay, and the adjacent country, most of the manufactories of the United States receive the best materials for grinding iron and steel; these northern colonies and most of the Western States are supplied with the best grindstones for sharpening all kinds of cutting instruments; therefore it is obvious that as population and manufactories increase, so must the demand for the sandstone of this portion of the country supply a permanent source of commerce. Many years have elapsed since coal was first discovered at the South Joggins, on the east side of the Chignecto Channel, and while making a geological examination of the strata at that place for the General Mining Association, it appeared to me that by the direction of the different layers of rocks, that it could also be found on the opposite coast of New Brunswick. During that examination, I discovered and measured several strata of coal which had not been previously reported, and found the whole number to amount to nineteen, several of which are workable. Having ascertained the true course of these strata, a landmark on the opposite coast was noted down; but the exact point where the coal might be expected is covered with a superficial bed of gravel so far as it could be distinguished by a telescope; and, perhaps that circumstance has prevented its discovery on the N. Brunswick side, which is several miles distant, and I regret that my time has been too much occupied to pursue this enquiry further. The rocks of Cape Meranguin, Grindstone Island, and their neighboring shores, like those of the county of Cumberland, abound in fossil relics of the vegetable kingdom, belonging to that period in the earth's history when the plants from which the coal was formed were in a living state. There is scarcely a stratum along this interesting part of the Province that does not exhibit remains of some lofty arborescent plant, or humbler 4 species of the carboniferous tribes; all of these are now converted into sandstone or shale, according to the circumstances in which they were placed, and they cannot fail to produce reverence in the minds of all who behold them. Their vast dimensions show how frightful the period was when they lived, and their present petrified condition bears record of the changes and convulsions the crust of this earth has suffered. These once living vegetables now stand like sculptured monuments bearing testimony not only to their own former life, and place of abode, but their inscriptions which seem to defy even time itself, declare that this earth has been the theatre of catastrophes unknown in these later days. They now stand like beacons to guide the astonished geologist to the haven of truth, and the indelible characters they display are interpreted without the risk of error or danger of delay. Ferns form a considerable part of the fossil flora of this Coal field. They all seem to belong to arborescent species that previous to their destruction had obtained a growth truly astonishing. Equizetums, plants having some analogy to the common horsetail of our swamps, are common. The species found here are however extinct even in the tropical latitudes, and none of their kind has ever been seen in a living state. There are several species of Lepidodendron, plants resembling the fir tribes. Some of these are of enormous size. I discovered one 48 feet in length, and 3 feet in diameter at the largest end. It lay in a horizontal position, passing through several strata, and a large portion of its top had been carried away by the violence of the waves. There are many other varieties of fossil plants along these shores; but a full description of them cannot be given in these letters, as it would occupy the space intended for other matter. It may, however, be remarked, that all these plants were produced in a climate, at least, as warm as that between the present tropics, and the vegetation to which they bear any resemblance can only be found in warm regions. Many of them have no living successors, and it is far from being improbable, that even the warmest climate in the torrid zone would not supply sufficient heat to produce those families of the vegetable kingdom, that have long since ceased to exist upon this planet. It is certain, therefore, that the climate of this country was at one time extremely warm, that a remarkable reduction of temperature has taken place; and the earth has been clothed with plants adapted to the degrees of heat and light now shed upon it. By taking the most limited view of the great size of the fossil plants to which I have referred, and the luxuriant growth they must have enjoyed, we cannot fail to discover the vast quantity of materials produced by 5 the earth for laying up the stores of coal, which now add so much to the comfort and happiness of mankind. And we must also believe, that when those numerous tribes of the vegetable kingdom flourished, the earth was surrounded by an appropriate atmosphere, an abundant light, and it was as far as we can judge by comparison, every way fitted for sustaining extensive tribes of mammalia, and numerous races of aerial and terrestrial beings. It would be selfish in man, to suppose that this mighty herbage, of a former condition of our planet, was created solely to supply the fuel now found in the earth. It is far more in accordance with the all-wise Creator's works in general, that they were also given to nourish and bestow happiness to other creatures, which were co-evil with the forests now found changed into coal, or converted into solid rock upon our shores. But are the remains of those animals found? It is true there are many tribes of graminovorous animals inhumed in the earth, but some of them are discovered in situations which render it at all probable they fed on the tropical herbage of the coal period. They are, according to the most received geological opinions, separated from that herbage by extensive and deep deposits of other rocks, and by a period of time almost immeasurable. The celebrated Doctor Buckland, in his Bridgewater treatise, Vol. 1, page 62, says, ""no higher condition of vertebrata has yet been discovered in the transition formation, than that of fishes,"" an opinion confirmed by the labors of many other geologists, whose discoveries have been confined to moluscous radiated, and other animals occupying marine and lacustrine situations. But we should be careful how we infer from these facts, that there was not a corresponding exalted state of animal life to that of the vegetable kingdom, at the period referred to. And perhaps the time has not yet arrived, when a perfect theory can be formed which will explain the phenomena exhibited in the earth. It has been said by some that there has been a gradual increase in the number and perfection of plants and animals, since that remote period, when this earth first became habitable. The circumstances, however probable, as far from being proved; and there are many links
